

AGAPE / PARAYA

Officer Wireframe - Screen Descriptions

One short paragraph per screen. Loading and empty states omitted.

Feature 1 - Dashboard

Screen 1 - Default (Loaded)

The home page an officer sees after login. The left sidebar lists every module with **[x] Dashboard** filled black to mark it active; the top header carries the page title plus a notifications bell and a user pill. The content area lays out four KPI cards (Total Volunteers, Volunteer Hours, Active Programs, Pending Proposals) for an at-a-glance snapshot of the portfolio, followed by a 6-month volunteer-hours bar chart and an SDG Impact panel with horizontal progress bars for the four priority goals. Below the charts, a Top Barangays ranking and a Recent Programs table give the officer two more drill-in paths into the data. A floating AI Chatbot button and a help ? sit in the bottom-right and are available on every page.

Screen 2 - Notifications Open

The officer clicked the bell. The dashboard content dims to 40% opacity behind a 380-wide dropdown anchored under the bell. The panel header reads 'Notifications' with a *Mark all read* link on the right, then lists up to five recent items - each with an unread dot or read circle, a bold title, an italic context sub-line, and a relative timestamp. A 'View all notifications ->' link at the bottom opens the full inbox. Clicking outside the dropdown or pressing Esc closes it; opening the user menu also closes it because the two overlays are mutually exclusive.

Screen 3 - User Menu Open

Same overlay pattern as the notifications dropdown but anchored from the user pill in the header. The pill flips its caret upward and inverts to black with white text to confirm it is open. A narrow ~260-wide panel drops down showing an identity block (name, email, role in parentheses), followed by four shortcuts - *My Profile*, *Notification Preferences*, *Help & Support*, and a bolded *Sign Out* separated by a divider line so destructive actions sit apart from everyday ones.

Screen 4 - AI Chatbot Expanded

The officer clicked the chatbot launcher in the bottom-right. A tall 320-wide panel slides up over the right side of the now-dimmed dashboard. Its black title bar reads 'AGAPE Assistant' with an X close. Inside, a sample conversation shows a left-aligned greeting bubble, a right-aligned user question filled black, an answer bubble with real numbers, and an italic *[TOOL CALL: ...]* trace underneath proving where the answer came from. Two suggested-prompt buttons sit above a composer with a dashed text field and filled **[SEND]** button. The footer reads *Powered by Claude * decision-support only* - a reminder that the assistant surfaces information but never makes binding decisions.

Feature 2 - Proposals

Screen 1 - List (Default)

The main proposals workspace. Five summary cards at the top show Total / Draft / In Review / Approved / Rejected counts; a pipeline-phase panel underneath shows where the in-review proposals sit across the 8-phase DYCI extension framework (Diagnostic, Research, Filing, Execution). Below that is a filterable table with search, status dropdown, and date-range inputs, listing every proposal with title, current pipeline stage, budget, and a status pill. Each row has a [...] action menu (View / Edit / Duplicate / Withdraw / Print PPF). The black [**+ NEW PROPOSAL**] button is the only filled-black action on the page, drawing the eye to the primary task.

Screen 2 - New Proposal (Form)

Right-side sheet (720 wide) that overlays the dimmed list. The form is grouped into three sections - Project Details (title, rationale, objectives), Beneficiaries & Output, and Timeline / Budget / Location. A boxed **income-generating gate** with a labeled checkbox and warning text reminds the officer that PARAYA only funds non-income-generating projects - ticking it means pre-screening will auto-reject. The sheet auto-saves every 30 seconds; the sticky footer has [**CANCEL**] and filled-black [**CREATE PROPOSAL**], which saves as a Draft rather than submitting it. SDG alignment and prior-proposal references sit below the fold.

Screen 3 - Detail (Draft)

Proposal detail in its draft state. The title sits up top with a (*draft*) badge, followed by the approval pipeline strip with six pills (Draft is filled black to show current stage). Sections show rationale, objectives, a Timeline / Budget / Barangay row, SDG alignment tags, and a Community Validation block that must be marked complete before pre-screening per the PARAYA framework Phase II. The primary [**> SUBMIT FOR REVIEW**] button advances the proposal to Submitted and locks every field; small recycle and X icons next to it are Withdraw and Reject shortcuts. *Edit Proposal* and *Delete* links at the bottom remain available until submission, and [**Print Project Participation Form**] in the header lets officers print the official PPF at any time.

Screen 4 - Detail (Pre-Screening Failed)

Same detail layout but the pipeline strip shows 'Pre-Screening' with a failure indicator and a prominent failure card lists the automated checks that failed - missing SDG mapping, income-generating flag set, missing endorsement letter, or budget over threshold. Each failed check explains what needs to change. The action buttons swap to [**REVISE & RESUBMIT**] (sends the proposal back to Draft so the officer can edit) and [**WITHDRAW**]. An audit trail at the bottom captures who ran the pre-screen and when, since the gate is automated rather than human-reviewed.

Screen 5 - Detail (Finance Review)

Pipeline shows 'Finance' filled black. The page adds a Finance Review section with a budget breakdown table (item, qty, unit cost, total), a clearance checklist (CHED budget rules, permitted line items, no double-funding), and a reviewer notes textarea. Action bar exposes [**APPROVE**], [**REQUEST REVISIONS**], and [**REJECT**], visible only to users with the finance reviewer role. Approval here advances the proposal to the Approved terminal state; rejection or revision requests route it back to the author.

Screen 6 - Detail (Approved)

Pipeline shows 'Approved' as the final filled-black pill. A success banner at the top confirms the proposal cleared all gates and identifies the approver and approval date. Two prominent CTAs appear - [**CREATE PROGRAM**] (spins up a linked program seeded from the proposal's fields) and [**PRINT PPF**] (opens the printable Project Participation Form with signatures). The proposal becomes read-only; only the admin role can re-open it. A small audit trail at the bottom shows every stage transition and reviewer name.

Screen 7 - Detail (Rejected)

Terminal state. The pipeline strip displays a rejected indicator and the body displays the rejection reason from the reviewer plus the audit trail of who rejected and when. Action options shrink to [**APPEAL TO DIRECTOR**] (escalates to the director's queue with a comment field) and [**DUPLICATE AS NEW DRAFT**] (clones the proposal so the officer can address the feedback and start over without losing the original record). The original stays in the system for the historical record and shows up in the Rejected count on the list.

Screen 8 - Detail (Revisions Requested)

The proposal is back with the author. A boxed reviewer-comments block lists the requested changes with the reviewer's name, role, and timestamp - each comment can be marked as addressed once the officer edits the related field. The proposal switches back into edit mode with form fields editable, and the primary action becomes [**RESUBMIT FOR REVIEW**] once changes are saved. A small diff badge marks fields that have been edited since the last submission so the reviewer knows what to re-check.

Screen 9 - PPF Print View

Full-page printable Project Participation Form on letter-sized paper. It renders DYCI letterhead, proposal metadata (title, date, proposer, barangay), full rationale and objectives, a beneficiary breakdown, the budget table, a signatures block for the proposer, the director, and the barangay captain, plus CHED reference codes. The application sidebar and header are hidden for clean printing. A floating [**PRINT**] button triggers the browser's print dialog; a [**Download as PDF**] option is also available for donor/email distribution.

Feature 3 - Programs

Screen 1 - List (Default)

Programs module home. A KPI strip shows Active / Upcoming / Completed counts at a glance. Below, a filterable table lists every program with title, lead officer, barangay, start date, status, and a quick-actions menu. Filters across the top include status, lead, barangay, and date range. The black [**+ NEW PROGRAM**] button is the primary action - it can spin up a program from an approved proposal or from a blank slate (rare, used for internal events that don't require formal proposal approval).

Screen 2 - New Program Form

Sheet-style form. The officer first picks the source proposal (if any) and the form auto-fills title, barangay, objectives, and budget from it. They then add activity dates, expected beneficiaries, lead officer, and any volunteer roles needed. A 'Mark this program as Brigada-style series' toggle links it to a recurring framework so future iterations auto-anchor against the same indicator targets. [**CREATE**] saves to draft so activities can be planned before going live.

Screen 3 - Detail Overview

Program detail header with title, status pill, lead, dates, and barangay. Four tabs - Overview, Activities, Budget, Volunteers. The Overview tab shows objectives, indicators-to-date (e.g., '320 of target 500 beneficiaries reached'), a feed of recent updates, and a sidebar with proposal link, donor contributions, and SDG alignment. The header right side has [**Mark complete**] (available only when the program is ready to close).

Screen 4 - Detail Activities

Activities tab listing every scheduled and past activity for the program. Each row has title, date, location, attendance count, and report status (Activity Report / Financial Report - both required before the program can be marked complete). A filter chip strip above the table separates upcoming, in-progress, completed, and missing-report states. [**+ Add activity**] opens the activity dialog; each row's [...] menu exposes Edit, Open attendance, File report, Cancel.

Screen 5 - Detail Budget

Budget tab with a side-by-side table of planned vs actual line items, plus a remaining-balance card up top. Adjustments require a justification note for the audit log. Linked donations show as inflows in a left column; distributions show as outflows in a right column. A burn-rate sparkline helps the officer see whether the program is on track to finish on budget.

Screen 6 - Detail Volunteers

Volunteers tab listing students signed up for the program with their college, role, hours logged, and attendance rate. Filters separate active / withdrawn / pending volunteers. [**+ Assign volunteer**] opens a picker filtered by skills and availability, drawing from the global volunteer pool. Each row links to the volunteer's profile and offers a shortcut to message them via the forum.

Screen 7 - Add Activity Dialog

Modal with date / time / location / lead / expected attendance / objectives. Toggles for 'requires attendance OTP' (turn on if check-in tracking is needed) and 'open to walk-ins' (allows non-pre-registered volunteers to join). Saving schedules the activity, adds it to the volunteer schedule calendar, and creates an empty Activity Report and Financial Report stub that need to be filled in after.

Screen 8 - Add Report Dialog

Modal for filing the two reports each activity needs - Activity Report (what happened, lessons learned, photos) and Financial Report (budget vs actual line items). The dialog has two tabs; both must be saved before the activity is marked reported. Photo attachments go to the activity-photos Supabase bucket. The Financial tab inherits planned line items from the program budget and asks the officer to fill in actuals.

Screen 9 - Mark Complete

Confirm dialog before closing the program. A checklist enforces that all activities have both reports filed, every approved donation is distributed, and at least one impact indicator is logged. Marking complete locks all edits, auto-schedules the 6-month and 1-year follow-up records in the Impact module, and unlocks the post-program impact summary and AI-narrative report for donor distribution. The dialog warns explicitly that this action cannot be undone without admin intervention.

Feature 4 - Surveys

Screen 1 - List (Default)

All surveys in the office, filterable by Draft / Published / Closed. Each row shows title, audience (barangay scope or office-wide), response count, completion rate, and last-response timestamp. Search bar across the top. The black [**+ NEW SURVEY**] button opens the builder. A 'Templates' shortcut to the right reuses existing surveys (e.g., the twice-yearly Community Profile baseline).

Screen 2 - Builder (Tab)

Three-pane builder layout. The left column is a drag-handle list of all questions in the survey; the center is a live form preview showing how respondents will see the page; the right is an Add-Question palette with question-type cards (single-choice, multi-choice, scale, text, date, file upload, conditional). Officers reorder by dragging. Top tabs switch between Builder, Settings, and Preview.

Screen 3 - Question Edit Panel

Right-side panel that opens when a question is clicked in the builder. Inputs for the prompt text, question type (changeable via dropdown), required toggle, choice list (reorderable), validation rules (e.g., 'must be a number between 0-100'), and conditional-show rules ('show only if Q3 = Yes'). A 'Preview as respondent' link shows the question in isolation.

Screen 4 - Builder Settings

Settings tab covering survey title, intro copy, audience scope (which barangays / which roles can submit), anonymous-toggle, deadline date, thank-you message, and per-event notification routing (alert me when a response comes in). Includes a 'Reuse template' picker to copy questions from an existing survey, useful for the twice-yearly community profile cycle.

Screen 5 - Builder Preview

Renders the survey exactly as a respondent will see it - no editor chrome, just the form. Officers can scroll through every page, trigger conditional questions, attach test files, and submit a test response that is flagged as test and does *not* count toward real results. The big [**PUBLISH**] button at the bottom flips the survey live; once published, the structure becomes locked except for non-breaking edits like fixing typos.

Screen 6 - Analysis Charts

Per-survey analytics view. Sticky header shows response total and completion rate. Each question renders the appropriate chart - bar for choice questions, histogram for scale, word-cloud for text - with the underlying counts visible on hover. Filters above let the officer slice by barangay, demographic, or date range. An [**Export to Excel**] button downloads the raw responses for offline analysis.

Screen 7 - Pre/Post Compare

Two-column comparison of the same survey administered before and after an intervention (typically the baseline + 6-month follow-up). For each question, the two distributions are shown side-by-side with delta arrows and percentage change. Used for impact measurement against the indicators table and as input for narrative reports.

Screen 8 - Cross Tabs

Pivot-table grid letting the officer cross any two questions. Rows are the values of question A, columns are the values of question B; cells show counts and percentages. Useful for spotting correlations (e.g., income bracket x access to internet, or sitio x child-out-of-school rate). The matrix can be exported as CSV for further analysis.

Screen 9 - Public Response Form

Respondent-facing view of a published survey - no sidebar, just the DYCI/PARAYA header, a progress indicator across the top, and the question stack. Mobile-friendly so it works from a barangay hall on a tablet. Used by walk-ins and by volunteers conducting interviews in the field on behalf of beneficiaries. Each submission creates a row in survey_responses; the same survey can be submitted multiple times if it's set up for that.

Feature 5 - Volunteers

Screen 1 - List (Default)

All volunteer-students in the office. Columns - name, college, total hours, status, last log. Filter chips for active / on-leave / suspended, plus search and barangay-assignment filter. A 'Pending Approvals' callout above the table summarises how many logs are waiting for officer review. Each row's [...] opens the actions menu (View / Edit / Suspend / Re-assign / Export hours certificate).

Screen 2 - Pending Logs Expanded

The 'Pending Approvals' section is expanded into a list of submitted activity-log entries. Each row shows the volunteer, activity, hours claimed, evidence (photo or signature), and approve / reject buttons. A multi-select with [**Approve selected**] and [**Reject selected**] at the bottom enables batch processing for high-attendance events like Brigada Eskwela. Rejecting an entry requires a short reason that the volunteer sees in their inbox.

Screen 3 - Detail (With Logs)

Volunteer profile page. Header with avatar, name, college, contact, total hours, and an activity progress bar against the semester target. Below, a logs table lists every approved/pending entry with date, activity, hours, status, and the approver's name. [+ ADD LOG] lets officers add a log on the volunteer's behalf (useful when a volunteer forgets to log). Right rail shows skills, signed-up programs, and recent attendance.

Screen 4 - Detail (Empty Logs)

Same detail header but the logs table is replaced with an italic line - *'No hours logged yet.'* A first-log CTA encourages the officer to add an entry or assign the volunteer to a program activity. The right rail still shows the volunteer's skills and any programs they've signed up for - those are the natural next steps to actually generating hours.

Screen 5 - Detail (Suspended)

Status pill in the header reads *suspended*. A banner explains the suspension reason and the unsuspend-on date (or 'indefinite, by admin'). The logs table is read-only; new logs cannot be filed against a suspended volunteer, and pending logs auto-reject when suspension takes effect. Admin / Director can unsuspend from the actions menu, which creates a record in the audit log.

Screen 6 - Row Actions Menu

Context menu (popover) anchored to a row's [...]. Options - View detail, Edit, Suspend, Re-assign program, Export hours certificate (a downloadable PDF for OJT or CWTS credit). Destructive actions like Suspend or Delete sit at the bottom behind a confirm step. The menu adapts to the volunteer's current status (e.g., 'Unsuspend' replaces 'Suspend' for already-suspended volunteers).

Screen 7 - Bulk Approve Confirm

Confirm dialog after the officer multi-selects pending logs and hits 'Approve selected.' Lists the volunteers and total hours about to be approved, plus a typed-confirm pattern ('Type APPROVE to continue') to prevent fat-finger approvals during a large batch. After approval, each volunteer gets an in-app notification confirming their hours and total running balance.

Screen 8 - Hours Summary

Aggregated hours by college, by program, and by month. Three side-by-side cards with bar / donut visuals. Used for end-of-semester CHED reports and to identify imbalanced distribution of volunteer time across the office's program portfolio. A small table at the bottom lists the top-5 most-engaged volunteers with a 'Send appreciation' shortcut that uses an email template.

Feature 6 - Attendance

Screen 1 - Selected (No Code)

Officer picked an activity from the left-side list. Right pane shows the activity meta (title, date, location, expected count) and a placeholder where the live attendance code will appear. [**GENERATE CODE**] button is the primary action - clicking it creates a fresh OTP (One-Time Password) keyed to this activity. The list on the left filters to activities happening in the current 24-hour window by default; toggles expand to yesterday's or tomorrow's activities.

Screen 2 - Live Code (with QR)

Attendance OTP is active. Right pane shows a large 6-digit code and a matching QR. A timer counts down to expiry (default 30 minutes). Volunteers either scan the QR with their mobile or type the 6-digit code into **/volunteer/check-in**. The officer keeps this screen open on a laptop or projector during the activity so attendees can see it. [**Rotate**] and [**Extend**] buttons sit below the code for recovery.

Screen 3 - Full Roster

Live roster list under the active OTP - each check-in pops in with timestamp and method (QR / manual). The count vs expected attendance is displayed at the top with a progress bar. Officers can manually mark no-shows after the activity ends, which removes them from the auto-credit list. The roster supports search and basic edit (e.g., fix a wrong check-in time) with an audit-log entry per change.

Screen 4 - Code Expired

Right pane shows the previous code crossed out with an *EXPIRED* ribbon. The roster is frozen and no new check-ins can land. Two recovery options - [**EXTEND BY 30 MIN**] (reuses the same code, preserving the roster) and [**ROTATE NEW CODE**] (generates a fresh code, also preserving the existing roster). The choice depends on whether the officer suspects the old code was shared too widely or just that the activity ran long.

Screen 5 - Rotating Code

After tapping rotate, the previous code is voided and a fresh OTP+QR pair appears. The roster stays - existing check-ins are preserved. Used when an officer suspects the old code has been shared outside the activity (e.g., reposted on a group chat). The audit log captures the rotation event with the officer's name and timestamp so any disputes can be reconstructed later.

Screen 6 - Manual Entry

Modal for adding a volunteer to the roster without an OTP - e.g. for someone whose phone died or who arrived late after the code expired. Officer picks the volunteer from a searchable dropdown, enters arrival time, and adds an optional note. Manual entries are flagged in the roster (a small 'manual' badge) for the audit log, since they bypass the automated check-in proof.

Screen 7 - Volunteer Check-in (Mobile)

Volunteer's mobile view after scanning the QR. The activity title and barangay appear up top, then a 6-digit confirm field (auto-filled from the URL the QR encodes) and a big [**CHECK IN**] button. After tapping, a success state shows the volunteer's name, the activity, and the timestamp. They can also enter the code manually if QR scanning isn't available.

Screen 8 - Attendance Summary

Post-event summary view - total attended, late arrivals, no-shows, walk-ins. Per-volunteer rows with arrival method and hours credited. [**Export CSV**] for record-keeping. This view feeds the volunteer hours module - approved attendance translates directly into logged hours, which the system queues for officer approval per the standard approval flow.

Feature 7 - Partnerships

Screen 1 - List (Default)

Partner barangays module. The left side is a filterable table (name, captain, total programs, active needs, partnership age); the right side is a map of Bocaue with each partner barangay outlined as a polygon. Clicking a row on the table flies the map to that barangay; clicking a polygon on the map highlights the row. [**+ ADD PARTNERSHIP**] is the primary action - reserved for the Director role.

Screen 2 - Add Form

Sheet form to register a new partner barangay. Fields - name, captain (with phone + email), total population, total households, partnership start date, MOA file upload, and a map pin for the barangay hall location (drag to refine). The captain becomes the approver for community needs submitted from this barangay. A 'Notify captain' toggle sends an account-invitation email at save time.

Screen 3 - Edit Form

Same fields as Add, pre-filled with the current values. Each edit saves an entry to the partnership-history audit log, so every change is traceable. Editing the captain triggers a confirmation step warning that the captain change will revoke the previous captain's approval access to needs submitted by this barangay.

Screen 4 - Detail Overview

Per-barangay detail page. Header with name, captain, population, household count, partnership age. Tabs - Overview, Timeline, Programs, Households, Skills/Assets. The Overview tab shows a mini-map, key contacts, recent activity feed, and a small KPI strip (active programs / open needs / total hours invested). Right rail has 'Quick actions' shortcuts like message captain, schedule visit, log observation.

Screen 5 - Detail Timeline

Append-only timeline of partnership events - MOA signed, MOA renewed, partner officer change, major activities hosted, escalations, follow-up visits. Filterable by event type. Used for tracking relationship history when officers turn over, so a new officer can read the full backstory in one place rather than chase down predecessors.

Screen 6 - Map Polygon Popup

Officer clicked a barangay's polygon on the map. A popup card appears with name, captain, active programs count, pending needs count, partnership age, and an [**Open detail ->**] link. Clicking outside the popup closes it. Useful for quickly identifying a barangay when planning a multi-barangay program based on geography.

Screen 7 - Inactivate Confirm

Destructive confirm before marking a partnership as inactive. Lists the consequences - active programs paused, community needs frozen, captain loses access to approve new needs, and the barangay disappears from default lists. A typed-reason field captures why so the audit log explains the decision. Inactivation is reversible from the inactive detail page.

Screen 8 - Inactive Detail

Read-only version of the detail page after a partnership has been inactivated. A banner across the top explains who inactivated, when, and why. Programs and needs are visible but frozen - no new ones can be added. [**REACTIVATE**] is the only available action; it opens a confirm dialog that lets the officer optionally re-invite the captain.

Screen 9 - Row Actions Menu

Context menu off the [...] in the table. Options - View detail, Edit, View on map, Open captain profile, Message captain, Schedule visit, Inactivate. The menu adapts to the partnership's current state (e.g., Reactivate replaces Inactivate for already-inactive partnerships).

Feature 8 - Field Observations

Screen 1 - List (Default)

Field observation module - quick captures made by officers or volunteers in the field that may or may not become formal community needs. The list view has date, barangay, observer, brief description, photo thumbnail, and status (raw / promoted / dismissed). Designed for noticing things before they're worth formalising - an opening for early intervention.

Screen 2 - List Filtered

Same list with active filters applied - by barangay, date range, observer, or category. A filter chip strip above the table shows what's applied, with an X on each chip to remove it. A 'Clear all' link resets. The filter URL is shareable so officers can paste it in a forum thread to point teammates at a specific subset.

Screen 3 - New Observation

Capture form. Fields - what was observed (textarea), where (barangay + sitio + optional map pin), when (defaults to now), category (sanitation / education / health / etc.), and photos (camera or gallery on mobile). Designed for mobile-first quick capture during a barangay visit, so the form is short and the photo upload is prominent.

Screen 4 - Edit Observation

Same form as New, pre-filled. Edits are audit-logged with the editor's name. Photos can be added or removed but not replaced - the photo history is preserved so reviewers can see what was originally captured. Category changes propagate to the AI insights grouping.

Screen 5 - Detail View

Single observation detail page. Photo gallery up top (swipeable), then the observation text, location pin, tags, and a comments thread for officers to discuss the observation. Right rail shows the observer's profile, the related barangay's stats, and a 'similar observations' list. Actions - [**Promote to need**], [**Dismiss**], [**Edit**].

Screen 6 - Promote to Need

Dialog that converts an observation into a formal community need that goes through the captain approval workflow. Pre-fills the need form from observation fields (description, category, location), lets the officer edit before submitting, and links the resulting need back to the original observation so the history is preserved.

Screen 7 - Photo Upload

Photo attach UI inside the New / Edit forms - drag-and-drop zone, thumbnails of attached photos, per-photo caption input, and a 'blur faces' toggle for privacy. Photos go to the activity-photos Supabase bucket. Maximum 10 photos per observation; each photo can be up to 8MB before client-side compression kicks in.

Screen 8 - Insights by Category

AI-generated rollup grouping observations by themes (flooding, sanitation, education, income, health). Each theme shows the count, top barangays, and a one-sentence narrative. Helps officers spot emerging patterns across the office's coverage area before they become urgent. Clicking a theme drills into the filtered observation list.

Screen 9 - Delete Confirm

Destructive confirm. Warns that the observation will be permanently removed (or only soft-deleted if it has already been promoted to a need, since the linked need still references it). A typed-reason field captures why for the audit log. Deletion is reserved for clear duplicates or test entries - active observations should be dismissed instead so the history stays intact.

Feature 9 - Community Profile

Screen 1 - List (Default)

Top-level community profile module. One row per partner barangay with population, household count, needs density, last-profiled date, and a 'completeness' percentage. [**+ Add household**] is the primary action; clicking a barangay row drills into the barangay dashboard.

Screen 2 - Barangay Dashboard

Per-barangay overview. KPI strip shows households profiled, average household size, and the top need category. Side-by-side charts of household income distribution and a needs heatmap by sitio. A 'Last profiling cycle' indicator helps researchers see whether the barangay is due for a refresh (the framework asks for twice-yearly cycles).

Screen 3 - Sitio Drilldown

Drills into one sitio within a barangay. Lists the households profiled there with quick filters by income, household size, and at-risk flags (children out of school, elderly with chronic illness, etc.). Mother Leaders use this view to plan their next round of home visits and to confirm whether at-risk flags have changed.

Screen 4 - New Household Form

Capture form for a household profile - head of household, members (with relationship + age + occupation), address, income source, income range, key needs/risks, and an optional photo of the dwelling. The form is long so it's chunked into sections (Basic info, Members, Income, Needs, Photo) with a progress indicator at the top.

Screen 5 - Edit Household

Same form pre-filled. Edits are audit-logged. Some fields require Mother Leader signoff before saving (e.g., adding a new at-risk flag, which has program-eligibility consequences). Member edits are tracked individually so household composition history is preserved.

Screen 6 - Household Detail

Single household profile. Members list with demographics, full needs assessment, history of program interactions, photos. Actions - Edit, Schedule follow-up visit, Tag for next program outreach. The right rail shows the household's sitio context and nearby households with similar profiles.

Screen 7 - Income Distribution

Single-page chart drilling into income brackets across the barangay. Stacked bars by sitio with a comparison line for the Bocaue / Bulacan provincial average. Source citations sit underneath. Used for proposal-writing - officers can quote real numbers when justifying an intervention's target group.

Screen 8 - Needs Heatmap

Sitio-level heatmap of community needs. Each sitio is a tile; darker shading = more open needs. Click a tile to drill into the Sitio Drilldown. Filter chips up top let the officer focus on a single need category (education, health, livelihood, infrastructure, etc.) so the heatmap re-shades to that single dimension.

Screen 9 - Delete Confirm

Destructive confirm before deleting a household profile. Warns that linked program beneficiaries will be re-anchored to 'unknown household,' losing the demographic detail. Typed-reason field for the audit log. Deletion is rare - households that have moved out are usually marked inactive instead so the history stays.

Feature 10 - Skills & Assets

Screen 1 - Skills List

Skills inventory across all partner barangays. Each row - skill name, barangay, count of people with that skill, last verified. Filter chips for category (technical, livelihood, health, agricultural, etc.). Anonymised at the individual level for privacy - the database stores counts, not names, since the survey workflow asks people to self-identify rather than be listed.

Screen 2 - Skills Heatmap

Barangay-by-skill matrix grid - rows are barangays, columns are skill categories, cells show density (darker = more people with that skill). Helps officers spot which barangays already have capacity in an area (potential trainers) and which are gap areas (potential trainees). Clicking a cell drills to the underlying records.

Screen 3 - New Skill

Form to add a skill record - barangay, skill, count of people with that skill, source (survey / interview / self-report), date verified. Used when the researcher returns from a community profiling visit and needs to update the inventory. A 'related skills' suggestion appears below the skill field to encourage consistent naming (e.g., 'sewing' vs 'dressmaking').

Screen 4 - Edit Skill

Same form pre-filled. Edits audit-logged. Counts can be incremented or decremented over time - the system keeps a running total per skill per barangay so trends are visible in the analytics module. Editing the source citation is supported so older records can be annotated with a follow-up survey reference.

Screen 5 - Assets List

Community assets inventory - barangay halls, multi-purpose centers, computers, tents, vehicles, equipment that can be loaned for activities. Each row has type, owner, condition, barangay, last verified. Filter chips for type (venue / equipment / vehicle) and availability (free / busy / restricted).

Screen 6 - New Asset

Form for adding a community asset - type (venue / equipment / vehicle), owner (barangay / school / NGO / individual), condition, capacity (e.g., 'seats 200'), location pin, and contact info for borrowing. A 'standard equipment' toggle marks recurring items (e.g., DYCI-owned tents) for fast lookup.

Screen 7 - Assets Map

Map of partner barangays with asset pins overlaid. Pin shapes represent asset categories. Click a pin to see asset details. Used when planning a program to find the closest available venue or to coordinate equipment loans between barangays. Filter chips above the map narrow to a single category.

Screen 8 - Delete Confirm

Destructive confirm for either a skill record or an asset. Includes a 'soft delete - keep historical record' option that hides the row from default views but preserves it for audits, used when an asset is destroyed or a skill cohort moves out of the barangay.

Feature 11 - Donations

Screen 1 - List (Default)

Donations module home. A KPI strip up top shows Total intake / Cash share / In-kind share / Pending distribution counts. A filterable table lists every donation with donor, item, quantity, value, date, and status (received / partially distributed / fully distributed). Filters by donor type, period, and status. The black [**+ LOG DONATION**] is the primary action.

Screen 2 - New Donation

Right-side sheet to capture an intake. Sections - Donor (name, type, contact), Item (cash / in-kind / service / equipment, description, qty, est. value), Intake (date, received-by, storage location), and an optional Recipient Assignment block for earmarking. The footer has three buttons - [**Cancel**], [**Save & Close**], and [**Save & Distribute**], which saves the donation and immediately opens the distribute dialog.

Screen 3 - Detail With Distributions

Donation detail page. Donor + item header at the top, then a progress bar showing the percentage of the donation that has been distributed, then a list of distribution rows (date, recipient, qty, distributor name). A remaining-balance card on the right suggests the next distribution based on open requests or earmarks. [**+ DISTRIBUTE**] opens the distribute dialog. Edit and Delete are available from the row menu.

Screen 4 - Distribute Dialog

Modal to record a distribution. Picks recipient type (program / barangay / household / individual), quantity (bounded by remaining balance), regular vs disaster mode toggle, and an acknowledgment checklist (photo on file, signature collected, no double-counting). Saving subtracts from the donation's remaining balance and adds the recipient to the donation's distribution list.

Screen 5 - Disaster Mode

A special dashboard view used during active disaster events. Shows the live event banner across the top, an open-requests queue (urgency-ranked from affected barangays), earmarked donations awaiting deployment, coverage gaps where supply doesn't meet request, and a live dispatch log with timestamps. Designed for fast-tempo coordination - shortcuts for SMS broadcasts and one-click dispatching.

Screen 6 - Cash vs In-Kind Analytics

Analytics sub-page. Two large charts - monthly value split between cash and in-kind, plus a stacked horizontal breakdown by donor type. Beneath, a table of top in-kind categories with value, recipients reached, and stock-on-hand. AI insights call out concentration risk (e.g., one donor is too large a share) and stagnant inventory (donations sitting in storage too long). Used for board-level reporting.

Screen 7 - Donor History

Per-donor profile. Lifetime KPIs (total value, donation count, people reached), then a history table of every donation with type, items, value, recipients. A 'Relationship notes' block captures soft info like preferred contact, renewal timing, donor's preferred framing of impact stories. Used to prep for donor briefings or thank-you letters.

Screen 8 - Edit Donation

Sheet form pre-filled with the donation's current values. Edits to amount or item type are flagged in the audit log. If the donation has distributions, the value field is locked behind an explicit 'Unlock to edit' link to prevent accidental amends that would make distributions inconsistent. The donor name change requires director-level confirmation.

Screen 9 - Delete Confirm

Destructive confirm. Warns if distributions exist (they will be removed too, and recipient counts will recompute). Requires the officer to type the donor name as a fat-finger guard. Optional reason field for the audit log - usually 'duplicate entry,' 'wrong donor selected,' or 'returned by donor.'

Feature 12 - Analytics

Screen 1 - Overview (Default)

Analytics landing page. Four KPI cards (Programs, Volunteers, Approved Hours, Donations) across the top, each with an icon and a sub-line of context. Then an SDG Impact strip with the four priority goals shown as progress bars. Below that, six chart cards in a grid - monthly volunteer hours, programs by status, donations by item type, community needs by category, top barangays by programs, and the proposal pipeline overview.

Screen 2 - Filter Sheet

Right-side sheet that opens when the officer clicks **Filters** in the page header. Inputs for partner barangay (dropdown of the office's 19 barangays) and calendar year. A live filter-preview block shows what will change before applying so the officer can double-check before they hit Apply. The sheet has three buttons in the footer - Apply, Reset, Cancel.

Screen 3 - SDG Impact

Sub-page focused on SDG alignment. Four big SDG goal cards with progress bars and supporting stats (programs aligned, beneficiaries reached). Below that, a year-over-year stacked-bar trend chart shows how each SDG's contribution has shifted over time. An AI insights panel on the right calls out under-represented SDGs and recommends specific program proposals to close the gap.

Screen 4 - Volunteers

Sub-page focused on volunteers. Five KPI cards (total, active, hours, avg per volunteer, attendance rate). A weekly trend line shows the last 12 weeks of hours logged. A top-10 leaderboard, by-college breakdown bars, and a retention & attrition block (returning vs new mix, dormant-volunteer flags, predicted attrition for the next 30 days) round out the page.

Screen 5 - Community Needs

Sub-page focused on the open community needs queue. KPIs (total submitted, pending captain approval, approved, returned for revision). Needs-by-category bar chart, an urgency mix donut, a sitio-level heatmap of where needs are concentrated, and a top-5 unmapped-needs panel that lists needs without a linked program.

Screen 6 - Proposal Pipeline

Sub-page that visualizes the proposal funnel - six stages from Draft to Approved, with conversion rates between each stage labelled on the connectors. Bottleneck callouts flag stages that are running over SLA. A time-in-stage breakdown chart and a rejection-reasons panel with an AI insight about repeat rejection causes (e.g., 'most rejections fail SDG mapping at first submission').

Screen 7 - Survey Analysis

Sub-page listing every survey with response count, completion rate, and last response. Clicking a survey opens a drill-in preview pane with the first few questions' charts and a right-side AI summary panel that produces narrative insights from the responses. Used as the entry point to the deeper Survey Analysis page in the Surveys module.

Screen 8 - AI Narrative Dialog

Modal that opens when the officer clicks **Generate narrative report**. The left side has the report config - type (quarterly impact / monthly progress / donor brief), time range, sections to include (checklist), tone (formal / donor-friendly / executive brief), and a free-text 'custom instructions' field. The right side shows a live preview of the streaming narrative as Claude generates it. Footer - Cancel / Save draft / Generate.

Feature 13 - Impact

Screen 1 - Metrics (Default)

Impact measurement home. Three tabs across the top - **Metrics, Stories & Testimonials, Follow-ups**. The Metrics tab shows four KPI cards (beneficiaries reached, families served, trainings conducted, materials distributed), then a filterable indicator table where each row is one logged measurement, and a small bar chart at the bottom summarising the indicator categories. [**+ Log indicator**] is the primary action.

Screen 2 - Log Indicator Dialog

Modal to log a new quantitative indicator. Officer picks the program, indicator type (beneficiaries / families / trainings / materials / volunteer hours / custom), value, unit, recorded date, and SDG tag. A disaggregation row (male / female / youth / senior) splits the total - the sums must reconcile to the total value. A free-text notes field captures context. Saved indicators are audit-logged so any later edits are traceable.

Screen 3 - Stories Tab

Stories tab of the Impact module. A card list of testimonials, case studies, pre/post narratives, and field observations - each tagged by type and program. Case-study and pre/post cards display formatted body text; testimonial cards lead with a quote-mark treatment. Stories form the qualitative side of impact measurement, complementing the indicator counts on the Metrics tab.

Screen 4 - Add Story Dialog

Modal to add a story. Type chips (testimonial / case study / pre-post narrative / observation), program picker, date, consent toggle, subject info (anonymizable), body text, optional auto-translation via AI for Tagalog stories, freeform tags, and a media attachment field for photo or voice note. Stored in the impact_qualitative table. Faces in photos are blurred by default in donor exports unless consent is explicitly recorded.

Screen 5 - Follow-ups Tab

Follow-ups tab. KPI strip shows Overdue / Scheduled / In Progress / Completed counts. Filterable table of every follow-up record with status, type (6-month / 1-year), associated program, scheduled date, completed date. Overdue rows are emphasized for visibility. A footer panel explains the reminder rules - when in-app alerts fire, when email reminders fire, when SMS escalations fire.

Screen 6 - Follow-up Detail

Single follow-up record. A top warning banner appears if overdue. A program overview block summarises the original program. A checklist of steps that must be completed for this follow-up (re-survey sample, teacher feedback, attendance vs dropout delta, capture testimonials, send final report). A pre/post comparison table populates as the checklist is completed, eventually unlocking the [**Mark complete**] action.

Screen 7 - Program Impact Summary

Program-level rollup that combines quantitative indicators, qualitative stories, and follow-up outcomes into a single shareable page. Used as the source material for narrative reports and donor briefs. [**Export PDF**] and [**Send to donor**] sit in the header. The page is structured by 'outcome' rather than 'feature' so it reads as a story rather than a dump of stats.

Screen 8 - Edit Indicator

Sheet form pre-filled with an existing indicator's current values. Warns at the top if the indicator already appears in a published AI report (since editing the number changes what the report cited). The audit trail at the bottom shows every prior edit with author name and timestamp. Indicators tied to closed programs are read-only unless the user is an admin.

Screen 9 - Delete Confirm

Destructive confirm. Warns about published reports that cite this indicator - they will not be retroactively edited; instead, a 'source data deleted' banner appears on them. Requires a typed reason and a typed-DELETE-INDICATOR confirmation. Useful for clearing duplicate or fat-finger entries; closed-program indicators usually need an admin to delete.

Feature 14 - Reports

Screen 1 - Reports (Default)

Reports module landing page. Four quick-action cards at the top (Quarterly impact PDF, Excel data export, Donor 1-pager, Compliance bundle) - each launches a tailored wizard. Below that, a recent reports table with title, type, created date, author, status, format, and per-row actions. A scheduled snapshots strip at the bottom lists upcoming cron-fed reports so the officer knows what's about to auto-generate.

Screen 2 - New Report Wizard

Step 1 of 4 of the report builder. Officer picks one of four report types (Compliance bundle / Quarterly impact PDF / Donor 1-pager / Raw data export). Each type card shows the audience, format, and length so the choice is informed. Progress bar at the top tracks the four-step flow; footer has Cancel and Next.

Screen 3 - Section Picker

Step 3 of 4. Two-column layout - left is the library of 14 available sections (cover page, executive summary, KPI dashboard, SDG progress, programs delivered, stories, photo gallery, methodology, etc.); right is the drag-orderable list of sections currently in the report, plus a page-count estimate. Each section can be removed individually or reordered.

Screen 4 - Preview

Live preview after generation. The left rail lists the sections like a table of contents; the right side renders the selected section in its final formatted state. The action bar in the header - Edit / Re-generate / Send to donor / Download / Publish. A quick facts panel below the section list shows page count, AI generation cost, sources cited, and generation timestamp.

Screen 5 - Send to Donor

Modal to email the report. Audience picker (specific donors / all partner barangays / internal / public link), recipient checklist with each donor's funding share for the period, editable email subject and body templates, attachment list, and tracking options (open tracking, auto-log to donor history, schedule send for later). The send action creates audit-log entries per recipient.

Screen 6 - Scheduled Snapshots

Tab showing the cron jobs that auto-generate reports. Each schedule card has trigger spec (cron expression), scope, recipients, next-run countdown, last-run status, and a per-row Run-now / Edit / Duplicate / Delete menu. A toggle switch on each card pauses or resumes the schedule without deleting it. The monthly snapshot and quarterly impact schedules are pre-seeded; office-specific ones can be added.

Screen 7 - Templates

Tab listing the reusable report templates. Two protected system templates (CHED Activity Report, CHED Financial Report) cannot be deleted or edited - they're system-managed for compliance. Custom office-specific templates can be created from any existing report via 'Save as template.' Per-template card shows section list, last-used date, and actions (Use, Preview, Duplicate, Edit, Delete).

Screen 8 - Delete Confirm

Destructive confirm for a report. Warns if the report has been sent to donors - deletion does NOT recall those emails. Offers an 'Archive instead - kept 90 days then auto-purged' softer option for officers who want to remove the report from default views without permanently destroying it. Typed-DELETE-REPORT confirmation required for the permanent option.

Feature 15 - Forum

Screen 1 - Threads List

Forum landing page. The left rail is a channel list (General, Announcements, Programs, Partnerships, Disaster response, Captains & Mother Leaders, Volunteers' lounge, etc.) with per-channel unread counts. The right pane is the thread list for the active channel. Each thread row shows title, author, last-reply meta, and unread badge. Pinned threads and live-event threads sit at the top. [+ New thread] is the primary action.

Screen 2 - Thread Detail

Single thread view. The original post (OP) card sits at the top with author avatar, role badge, body text, mentions, reactions, and a publication timestamp. A reply list underneath uses the same card structure. A sticky reply composer sits at the bottom of the page with mention / attach / emoji shortcuts so the officer doesn't lose context while scrolling.

Screen 3 - New Thread

Composer page for starting a new thread. Channel picker dropdown, title field, rich-text body editor with a toolbar (bold / italic / list / link / image / mention / code), attachments list, and options (notify channel members, subscribe me to replies, pin if permitted, lock-to-roles for private threads). Save-draft and Post-thread buttons sit in the footer.

Screen 4 - Mentions Inbox

Filtered view of every place the user has been mentioned with @. Left sub-nav lets the user switch between All threads / Mentions / My posts / Subscribed / Saved / Drafts. Mention cards show the source thread, the snippet around the mention, and a reply-inline action so the officer can respond without navigating to the full thread.

Screen 5 - Disaster Channel

Special live-event channel that auto-activates during a declared disaster. A red top banner identifies the event; the feed below is time-ordered posts from field volunteers, captains, mother leaders, and officers. A sticky SMS-broadcast composer at the bottom can blast a single message to every channel subscriber via Semaphore. Used for fast coordination during typhoons, fires, or other emergencies.

Screen 6 - Search Results

Full-text search results across threads, replies, and attachments. Each result has a type chip (Thread / Reply / Attachment), channel breadcrumb, highlighted matched terms in the body snippet, and an Open-thread link. The filter row narrows by channel, type, author, and date range. Used for recovering historical context (e.g., 'how did we handle the last Brigada Eskwela tarpaulin sourcing?').

Screen 7 - Channel Settings

Settings page for one channel. Sub-nav on the left for General / Members & permissions / Notifications / Moderation / Integrations / Danger zone. The General tab covers name, topic, visibility (public / role-restricted / invite-only), who can post, slow mode, auto-archive threshold, and attachments toggle. Only the channel owner or admin can edit.

Screen 8 - Moderation

Moderator queue. A KPI strip (open flags / resolved this week / members on warning / average resolve time) followed by a list of flagged threads or replies. Each flag has a severity tag, the reported reason, the reporter's name, and one-click mod actions (Approve in place / Remove / Warn user / Ban user / Move post to a different channel). Moderators are the Director and Admin roles.

Screen 9 - Delete Thread

Destructive confirm before deleting a thread. Warns about the reply count and how many different authors are involved - deleting impacts everyone, not just the OP. Offers two options - Archive (kept 30 days then purged) or Hard delete (permanent). A reason field is required for the audit log so the moderation decision is documented.

Feature 16 - Notifications

Screen 1 - Bell Dropdown

Header-level dropdown that opens when the bell is clicked. Lists the five most recent notifications with severity treatments (disaster, approval, mention, system). Each item has a left side-bar marking its category, a bold title, a context body line, and a timestamp. Quick toggles at the bottom for email / SMS / quiet hours give one-click control without leaving the dashboard. A link to full settings sits underneath.

Screen 2 - Inbox (Default)

Full notification inbox page. The left side-nav has folders - All / Unread / Mentions / Approvals / Reminders / System / Disaster / Archived / Snoozed - each with a per-folder count. The right side renders the notification feed grouped by Today / Earlier. Each notification card has an icon, title, body, source channel, time, and per-row Open / Snooze / Mark-read actions.

Screen 3 - Disaster Toast

Site-wide disaster banner across the header plus a stack of toast cards in the bottom-right. The first toast is a live alert with a primary CTA (e.g., Open response). The second tracks SMS broadcast delivery progress. The third shows director acknowledgement. Toasts auto-dismiss after a minute but can be pinned, and the banner persists until the disaster event is closed.

Screen 4 - Settings

Notification preferences page. The top row has channel cards (in-app / email / SMS / Messenger) with on-off and address per channel. The middle table is the per-event routing matrix - rows are event types (disaster, approval, mention, follow-up, etc.), columns are channels, cells are checkboxes for which channels each event hits. The bottom block configures quiet hours with weekday-only toggle.

Screen 5 - Detail View

A single notification expanded into a detail page. The top meta block shows the source, status, channels delivered to, and timestamps. The middle has the context that triggered the notification (e.g., the two needs awaiting approval, with links). A right-side panel lists related notifications. The action bar at the bottom - Open queue / Quick approve / Snooze / Forward / Mark read / Archive.

Screen 6 - Snooze Dialog

Modal that opens from the Snooze action. A preview of the notification being snoozed sits up top, then radio options for the snooze timing - Later today, Tomorrow morning, Monday morning, After my next meeting block, or Custom date-time. A 'note to future self' field captures why the officer is deferring. Warns explicitly that disaster alerts cannot be snoozed.

Screen 7 - Archived

Archived-folder view of the inbox. Cards are styled as faded or secondary to show they're done. Each card shows the auto-purge countdown (default 6 months for most categories, 5 years for disaster items per audit policy). Per-card Restore / Delete-now actions. A Search field above the list helps recover specific historical alerts during audits.

Screen 8 - Broadcast Compose

Director-only tool for sending a notification to many users at once. The left side is the compose form (severity / audience / channels / title / body / schedule). The right side shows a live preview of how the broadcast will look in the inbox and email, plus an automated sanity-check panel (severity matches body tone, audience scope sensible, last broadcast recency, SMS cost estimate).

Screen 9 - Delivery Log

Admin-only audit log of every notification sent. A KPI strip up top (sent today, open rate, SMS delivered, failed last 24h, SMS spend MTD). Filter bar by channel / status / range / recipient. The transaction table shows timestamp, channel, recipient, event, status, latency, and provider message ID. Failed rows expand to reveal the failure reason and any retry attempts.

Feature 17 - AI Chatbot

Screen 1 - Launcher (Collapsed)

Default state - a floating circular button (FAB) in the bottom-right corner of any page. A black filled circle with a lightning glyph in white. A small badge shows the count of suggested prompts queued for the user (e.g., 'try asking about your overdue follow-ups'). A black tooltip on hover reads 'Ask AGAPE assistant.' The launcher is available system-wide so officers can ask questions from any module.

Screen 2 - Conversation

The chatbot panel open in an active conversation. A right-side panel (~540 wide) with a black header strip, a history sidebar listing prior sessions, and the main scrollable message stream. Messages alternate between user (right-aligned, filled black) and assistant (left-aligned, outlined). A tool-call card and a streamed email-draft preview appear inline within the assistant's responses. A sticky composer at the bottom has a dashed input + attach / mention / send buttons.

Screen 3 - Tool Call Detail

Expanded reasoning trace for the assistant's latest answer. Numbered steps - thought, tool call (with args + result), thought, tool call, thought - showing exactly how the assistant produced the answer. Used for transparency and debugging. Each tool call shows the tool name, the inputs, the structured result, and the latency. Officers can review this when they need to verify the assistant's data sources before quoting them externally.

Screen 4 - Confirm Action

Modal that appears whenever the assistant wants to take a write action (e.g., create a reminder, send an email draft, log an indicator). Shows the proposed action name, parameters as a labeled list, an audit-log preview, and an 'Edit parameters' link so the officer can adjust before approving. Three buttons - **Deny**, **Dry-run only**, **Approve & run**. A 'trust this action type for 24h' opt-in skips future confirms for that action category.

Screen 5 - Citations

Assistant's answer with inline footnote citations like [1] next to each factual claim. A right-side sources panel lists the five cited sources (database tables, forum threads, audit log entries) with open-in-new links so the officer can verify each claim against the actual record. A footer at the bottom of the answer shows the assistant's confidence level and data freshness timestamp.

Screen 6 - Error State

Assistant ran into a problem. The card explains in plain language which parts succeeded and which failed (e.g., 'one tool timed out, another query failed because a migration hasn't run yet'). Offers a partial answer and recovery actions (Retry, Try fallback approach, Open admin to run migration). Includes a dev-only error log for the team to diagnose later.

Screen 7 - Context Attach

Manager screen for the conversation's attached context items. The top section shows currently attached items as cards (page / dataset / file / forum thread). A library browser below lets the officer attach more items by category (programs, partnerships, donors, surveys, reports, stories, activity logs). A previewer pane on the right shows the contents of whatever is highlighted in the library.

Screen 8 - Settings

Per-user assistant settings page. Left sub-nav - Behavior / Tools & permissions / Memory / Voice & language / Cost & quota / Privacy. The Behavior tab covers response style (concise / balanced / detailed), default tone, scope (which data the AI sees by default), proactive-suggestions toggles, action-confirmation default, and a free-text 'system prompt addendum' field for advanced users.

Screen 9 - History

Full conversation history list. A pinned section at the top, then a recent list. Each card shows the conversation title, the last assistant message snippet, the message count, and the relative timestamp. Per-row Continue / Export / Pin / Delete actions. A search field across all conversations helps the officer find a specific past chat when they remember the topic but not the date.

Feature 18 - Profile

Screen 1 - Overview

Profile module landing page. The left sub-nav has all profile sections. The top header shows the avatar, name, role, MFA / verified badges, and Edit / Change-photo actions. KPI cards underneath show programs led, hours coordinated, reports authored, and approvals pending. A 'Current week' schedule card and a recent-activity list round out the page, giving the officer a personal at-a-glance view of their work.

Screen 2 - Personal Info

Form covering the officer's name, display name (used in mentions), pronouns, bio, contact details (email / phone / office), languages, skill tags, and a visibility radio (everyone in the system / staff only / me only). This profile is what teammates see in mentions and in the people directory. Skill tags are used by program leads when picking volunteers or co-leads for new programs.

Screen 3 - Account & Security

Section with separate cards for Email, Phone, Password, MFA, and SSO - each with its own Change/Manage action. The MFA card lists what's enabled (authenticator app, SMS backup, recovery codes count) so the officer can see at a glance whether they have a second factor. A highlighted 'Danger zone' card at the bottom holds two destructive options - Suspend my account and Request data export.

Screen 4 - Change Password

Modal with current / new / confirm password fields plus a real-time strength meter. A live checklist validates length, character mix, not-recently-used, not-in-breach (HaveIBeenPwned API), and confirm-match. On save, the system signs the user out of all other devices as a security precaution and sends a confirmation email.

Screen 5 - MFA Setup

3-step wizard for pairing an authenticator app. Step 2 is shown here - a large QR code on the left, a manually-pastable secret string underneath, step-by-step instructions on the right, and a 6-digit confirmation input where the user types the code from their app to verify pairing worked. A 'can't scan - send SMS code instead' link offers an accessibility fallback.

Screen 6 - Role & Assignments

A read-only role banner up top with the user's role, scope explanation, and a Request-role-change CTA (which routes to admin). Below, cards for each assigned barangay (captain, active programs, pending needs), a table of programs the officer leads with status and SDG tags, and a role history list documenting every role transition with timestamps.

Screen 7 - Devices & Sessions

A list of every active session - the current session is highlighted in a thicker-bordered card. Other trusted devices have an End-session action. Suspicious sessions (failed MFA attempts, unusual locations) get a thicker-bordered alert card with 'This wasn't me - secure account' as the primary action, which kills all sessions and forces a password reset. The bottom shows recent sign-in history with anomalies emphasized.

Screen 8 - Activity Log

Chronological audit log of everything the user has done in AGAPE. A KPI strip (events last 30 days / top module / AI uses / write actions / approvals signed) up top, then a filterable transaction table with timestamp, module, action, subject, and status. Used by the officer to remember what they did when, and by admins for compliance audits. [**Export CSV**] in the header.

Screen 9 - Notification Preferences

The same surface as Feature 16 Screen 4 but accessed from inside the profile - delivery channel cards (in-app / email / SMS / Messenger), per-event routing matrix, and quiet hours configuration. Stored per-user so each officer can tune their alert mix. Disaster-tagged events are force-on and cannot be muted, per safety policy.

Screen 10 - Sign Out Confirm

Destructive confirm before signing out. Two radio options - 'this device only' (default; leaves other devices signed in) or 'everywhere' (kills all sessions, useful if a device is lost or compromised). A bordered warning block lists pending approvals and unsent drafts the officer might want to handle before leaving, with a 'Handle these first' shortcut. Cancel and Sign Out buttons in the footer.
