

COMMUNITY PROFILING - DATA ANALYSIS

SITIO BIHUNAN, BIÑANG 2ND, BOCAUE, BULACAN

Community profiling has long been recognized as a critical methodological approach for understanding the complex realities of local contexts, particularly in relation to social, economic, and environmental conditions. As argued by Sonya Love, Lucia Boxelaar, Josette O'Donnell, and Julie Francis (2007), community profiling is not merely a technical exercise of data collection, but a reflective practice that reveals multiple and sometimes competing constructions of a community. Rather than presenting a single, fixed narrative, profiling allows practitioners to uncover diverse experiences, needs, and perspectives that shape how communities function and respond to development interventions.

Similarly, in the Philippine context, Quitoriano (n.d.) emphasizes that community profiling is an action-oriented and collaborative process that captures the social, economic, political, and biophysical dimensions of a locality. It goes beyond conventional data-gathering methods by ensuring that overlooked or marginalized conditions are made visible, while also strengthening relationships between communities and local government units. This approach is particularly relevant in grassroots settings, where localized data serves as a foundation for responsive planning, disaster risk reduction, and social service delivery.

Anchored in these perspectives, this study analyzes household-level data collected from P. Lazaro Street and Sitio Bihunan, Barangay Biñang 2nd, Bocaue, Bulacan through a Family Profiling Form. The dataset reflects a community characterized by economic constraints, varied educational attainment, and emerging health and environmental concerns. Patterns within the data point to a concentration of households in lower income brackets, dependence on informal or unstable sources of livelihood, and the presence of chronic health conditions such as hypertension and diabetes. These realities are further shaped by limitations in access to healthcare, variations in housing security, and exposure to environmental risks such as flooding.

However, consistent with Love et al. (2007), the data should not be interpreted as a singular representation of the community. Instead, it reveals multiple layers of lived experience—from households that demonstrate relative stability to those facing compounded vulnerabilities related to income, health, and infrastructure. This multiplicity highlights the importance of approaching community profiling not only as a descriptive tool, but as a means of critical reflection that informs more nuanced and context-sensitive engagement strategies.

In this light, the present study seeks to examine the interrelated conditions of households and to surface key patterns and disparities that may otherwise remain obscured in generalized assessments. By situating empirical findings within the broader discourse of community profiling as both a methodological and reflective practice, the study aims to contribute to more grounded, inclusive, and responsive community engagement initiatives.

I. DEMOGRAPHIC PROFILE OF HOUSEHOLDS

To better understand the community, this section examines key demographic indicators: sex, civil status, age, and education. These factors provide the necessary context to interpret the respondents' living conditions and socio-economic challenges more accurately.

A. Sex/Gender Distribution

Examining the sex composition of households provides a crucial lens for understanding the social and economic dynamics of the community. Gender

distribution influences caregiving roles, household leadership, and participation in livelihood activities, while also shaping access to education, health services, and social support.

Sex/Gender	Frequency	Percentage
Female	119	50.64%
Male	116	49.36%
Total	235	100%

The Sex/Gender Distribution data shows a nearly balanced composition within the community: 119 females (50.64%) and 116 males (49.36%) out of a total of 235 individuals. This close parity between sexes is significant because it suggests that caregiving roles, household leadership, and participation in livelihood activities are likely shared across genders, rather than being heavily skewed toward one group.

Economically, the near-equal distribution highlights the importance of designing livelihood and social programs that are gender-inclusive. For example, training and employment initiatives should consider both male and female participation, while healthcare and educational services must address gender-specific needs without assuming one group dominates the population.

The data reflects a gender-balanced community structure, which can be seen as a strength. It provides opportunities for equitable participation in social, economic, and cultural activities, while also emphasizing the need to recognize and support the distinct roles and challenges faced by both men and women. This balance ensures that interventions aimed at improving community well-being can be designed to benefit all households inclusively.

B. Civil Status

Civil status is a key demographic indicator that reflects the social organization and household structures within a community. It provides insight into patterns of stability, caregiving responsibilities, and evolving family arrangements.

Civil Status	Frequency	Percentage
Married	25	42.37%
Single	22	37.29%
Widowed	4	6.78%
Live-in/Separated	3	5.08%
Not Specified/Other	5	8.47%
Total	59	100%

The civil status distribution of households provides a nuanced picture of social organization and family structures within the community. Out of 59

respondents, the largest proportion are married (42.37%), followed closely by single individuals (37.29%). This balance suggests that while traditional family arrangements remain prevalent, there is also a significant presence of unmarried individuals, reflecting a youthful demographic and possibly delayed or shifting marriage patterns.

The widowed category (6.78%)—though smaller—carries important social implications. Widowed households are often female-headed and may face compounded vulnerabilities, particularly in terms of income stability and caregiving responsibilities. Their presence highlights the need for targeted support mechanisms, such as social assistance or community-based care programs.

Meanwhile, live-in or separated households (5.08%) point to evolving family arrangements beyond conventional marriage. This reflects broader social changes, where cohabitation or separation is increasingly acknowledged as part of household realities. Such arrangements may influence household stability, caregiving dynamics, and children’s access to resources.

Finally, the not specified/other category (8.47%) underscores gaps in reporting or reluctance to disclose civil status. While relatively small, this group is significant because it may conceal marginalized or non-traditional arrangements that are less visible in formal data collection. Recognizing this category ensures that profiling does not erase diverse lived experiences.

C. Educational Attainment

Educational attainment is a vital demographic indicator that shapes both the immediate living conditions of households and their long-term socio-economic prospects. It reflects the community’s access to learning opportunities, the capacity to participate in skilled labor, and the potential for upward mobility.

Educational Level	Frequency	Percentage
Not Yet Attending School	18	8.22%
Pre-Elementary	1	0.46%
Elementary - Current	23	10.50%
Elementary - Undergraduate	9	4.11%
Elementary - Graduate	36	16.44%
High School - Current	29	13.24%
High School - Undergraduate	10	4.57%
High School - Graduate	43	19.63%
Vocational/Technical/ALS	6	2.74%
College - Current	13	5.94%

College - Undergraduate	6	2.74%
College - Graduate	18	8.22%
Postgraduate (Master’s, etc.)	1	0.46%
Not specified/Other	3	1.37%
No Educational Background	3	1.37%
Total	219	100%

The distribution of educational attainment reveals a broad base at the elementary and high school levels, with 36 elementary graduates (16.44%) and 43 high school graduates (19.63%) forming the largest groups. This indicates that while many households achieve basic and secondary education, progression beyond these levels is less common.

A notable 18 individuals (8.22%) are not yet attending school, reflecting either early childhood status or barriers to enrollment. The presence of college graduates (8.22%) and current college students (5.94%) demonstrates pathways to higher education, though these remain limited compared to the larger elementary and high school clusters. Vocational and technical training (2.74%) provides alternative skills development, while postgraduate attainment is rare (0.46%).

The small number of households reporting no educational background (1.37%) or unspecified entries (1.37%) highlights marginalization and gaps in reporting. Taken together, the data suggests that while basic and secondary education are widely attained, higher education remains accessible to only a minority, underscoring the need for sustained support in enrollment, retention, and progression to advanced levels.

II. SOCIO-ECONOMIC CONDITIONS

Socio-economic conditions provide a critical lens for understanding the material realities and livelihood strategies of households. Income levels, sources of livelihood, and access to government assistance directly shape the capacity of families to meet basic needs, invest in education, and secure healthcare.

A. Monthly Household Income

Household income is one of the most critical indicators of socio-economic well-being, as it directly shapes families’ ability to meet basic needs, invest in education, and access healthcare. Income levels also determine resilience against shocks such as illness, unemployment, or environmental hazards.

Educational Level	Frequency	Percentage
Below Php 5,000	18	30.51%
Php 5,000 - Php 9,999	10	16.95%
Php 10,000 - Php 19,999	17	28.81%

Php 20,000 - Php 39,999	12	20.34%
Php 40,000 - Php 59,000	0	0.00%
Php 60,000 and above	2	3.39%
Not Specified/Other	0	0.00%
Total	59	100%

The distribution of monthly household income in the community reveals a layered picture of socio-economic realities. A significant proportion of households, nearly one-third, earn below ₱5,000 per month. This points to deep economic vulnerability, where families are likely dependent on informal labor, daily wage work, or small-scale retail activities. When combined with those earning between ₱5,000 and ₱9,999, almost half of the households fall under the ₱10,000 threshold. This clustering underscores widespread poverty and limited capacity to invest in education, healthcare, or housing improvements.

Households earning between ₱10,000 and ₱19,999 represent a modestly stable group, accounting for nearly 29% of the total. These families may have more consistent employment in factories, services, or skilled trades, yet their resilience remains fragile. Inflation, job loss, or unexpected expenses could easily push them back into lower income brackets. Meanwhile, those in the ₱20,000 to ₱39,999 range, comprising about 20% of households, demonstrate relative stability. They are more likely to afford basic healthcare, education, and modest housing improvements, but still face challenges in long-term savings and investment.

The absence of households in the ₱40,000 to ₱59,000 bracket is striking. This “missing middle” suggests limited opportunities for gradual upward mobility, reflecting structural barriers in employment, education, and access to capital. Only two households report earnings above ₱60,000, highlighting stark inequality and the concentration of wealth in very few families. This imbalance paints a polarized economic structure: many at the bottom, a modest cluster in the middle, and a tiny minority at the top.

B. Sector Affiliation

Sector affiliation provides insight into the economic base of households and the broader community. It highlights how labor is distributed across formal and informal sectors, revealing both opportunities and vulnerabilities. By examining affiliations such as indigenous identity and overseas employment, gain a clearer picture of how cultural heritage and labor migration shape household stability, income sources, and social dynamics. These indicators are crucial for understanding livelihood diversity and resilience within the community.

Indigenous People	Frequency	Percentage
Yes	9	15.25%
No	50	84.75%

Total	59	100%
-------	----	------

The data shows that 15.25% of households identify as indigenous, while the majority (84.75%) do not. Although numerically smaller, indigenous households often carry unique cultural practices, knowledge systems, and community ties that enrich local identity. At the same time, they may face systemic challenges such as limited access to education, healthcare, and livelihood opportunities. Their presence underscores the importance of inclusive development strategies that respect cultural heritage while addressing socio-economic vulnerabilities.

Migrant or Overseas Worker	Frequency	Percentage
Yes	11	18.64%
No	48	81.36%
Total	59	100%

Approximately 18.64% of households report having migrant or overseas workers. This reflects the community’s connection to labor migration, a common livelihood strategy in the Philippines. Overseas employment often provides remittances that improve household income, education, and housing conditions. However, it also introduces social challenges, such as family separation and dependency on external income sources. The presence of migrant workers highlights both resilience and vulnerability: while remittances strengthen household finances, reliance on foreign labor underscores limited local opportunities.

Taken together, sector affiliation reveals the diverse economic and cultural foundations of the community. Indigenous households contribute to cultural richness but may require targeted support to overcome structural disadvantages. Migrant and overseas workers, on the other hand, demonstrate how global labor markets shape local realities, offering financial stability while creating social strains. These affiliations illustrate that household income and livelihood are not solely determined by local employment, but also by cultural identity and transnational labor dynamics. Recognizing these patterns is essential for designing responsive interventions that balance economic development with cultural inclusivity and social cohesion.

III.

LIVING CONDITIONS AND INFRASTRUCTURE

A.

Housing Tenure

This subsection outlines the different forms of housing tenure reported by households. The categories capture whether families own their homes outright, are paying through mortgage, rent, live with relatives, or occupy housing without legal ownership. Presenting these distinctions helps show the variety of living arrangements in the community.

Housing Tenure	Frequency	Percentage
Owned (fully paid)	18	30.51%
Owned (with mortgage)	4	6.78%
Rented	16	27.12%
Informal Settlers	10	16.95%
Living with Relatives	6	10.17%
Not Specified/Other	5	8.47%
Total	59	100%

The housing tenure data provides a clear picture of household stability and vulnerability within the community. Out of 59 respondents, the largest proportion of households are owned (fully paid) at 30.51%. This indicates that nearly one-third of families enjoy secure housing arrangements, reflecting long-term investment and relative economic resilience. A smaller group, 6.78%, own homes with mortgages, suggesting ongoing financial obligations but still a measure of stability compared to renters or informal settlers.

The second largest category is rented households (27.12%), which highlights a significant portion of families living under less secure arrangements. Renting often reflects limited resources or transitional circumstances, and these households may be more vulnerable to displacement or rising costs. Similarly, informal settlers (16.95%) represent a critical group facing insecurity, as they lack legal ownership and are more exposed to risks such as eviction, poor housing quality, and environmental hazards.

A notable 10.17% of households live with relatives rent-free, which may indicate extended family support systems but also potential overcrowding and dependency. Meanwhile, 8.47% fall under “Not Specified/Other,” reflecting gaps in reporting or alternative arrangements not captured by standard categories.

From a wider perspective, the distribution underscores a mixed housing landscape: while a substantial portion of households enjoy ownership and stability, a significant number remain vulnerable due to renting, informal settlement, or reliance on relatives. This pattern highlights the need for housing policies and community interventions that address both security of tenure and quality of living conditions, ensuring that vulnerable households are not left behind in development planning.

B. Utilities and Facilities

Access to utilities and facilities is a critical determinant of household well-being. Electricity, internet, water sources, and toilet facilities shape productivity, health, and educational opportunities.

ACCESS TO ELECTRICITY

Electricity access is a fundamental indicator of household well-being. It enables productivity, supports education, and ensures safety, while also serving as a marker of connectivity to essential infrastructure. Recording whether households have electricity provides a clear measure of inclusion in basic services and highlights areas where gaps in provision may exist.

Electricity Access	Frequency	Percentage
Yes	58	98.31%
No	1	1.69%
Total	59	100%

Electricity access in the community is nearly universal, with 58 out of 59 households reporting that they are connected to power. This translates to a coverage rate of about 98 percent, underscoring the strong integration of families into essential infrastructure. The presence of electricity supports productivity, education, and safety, while also serving as a marker of inclusion in basic services. The single household without access, though a small minority, highlights that gaps still exist and may be linked to geographic isolation, economic barriers, or housing conditions. As a whole, the data suggests that electricity is not a major vulnerability for the community, but ensuring that the remaining household is connected would strengthen equity and inclusivity in service provision.

ACCESS TO INTERNET CONNECTION

Internet access is an increasingly important indicator of household connectivity. It supports communication, learning, and participation in broader social and economic activities. In recent years, it has been consistently needed more than ever, as households rely on digital platforms for education, livelihood, and access to information. Documenting whether families are connected or not provides a clear view of digital inclusion and the extent to which communities can engage with opportunities beyond their immediate environment.

Internet Access	Frequency	Percentage
Yes	36	61.02%
No	23	38.98%
Total	59	100%

Internet access in the community shows a more uneven distribution compared to electricity. Out of 59 households, 36 reported having an internet connection while 23 did not, translating to a coverage rate of about 61 percent. This indicates that while a majority of families are digitally connected, a significant portion—nearly two out of every five households—remain excluded from online platforms. The presence of internet access supports communication, education, livelihood, and participation in broader social and economic activities, making it a consistently growing necessity in recent years. The gap in connectivity highlights disparities in digital inclusion, suggesting that some

households may face barriers related to affordability, infrastructure, or digital literacy. On the whole, the data points to progress in connectivity but also underscores the need for more equitable access to ensure that all families can engage with opportunities beyond their immediate environment.

HOUSEHOLD GARDENING

Household gardening is practiced in different ways, with families cultivating fruit-bearing plants, vegetables, herbs, or other crops within their living spaces. These activities not only show how households make use of available land but also reveal small-scale efforts to supplement food sources or maintain greenery at home. Recording these practices provides a clearer view of how gardening contributes to everyday household routines and community environments.

Household Gardening	Frequency	Percentage
Vegetables	20	28.99%
Fruit-bearing	7	10.14%
Herbal	5	7.25%
House plant / Household garden	2	2.90%
Community Garden	1	1.45%
Plants (unspecified)	1	1.45%
None	33	47.83%
Total	69	100%

Note: Multiple responses were gathered during the profiling.

The Household Gardening data shows a mixed picture of cultivation practices within the community. Out of 69 households, 20 reported growing vegetables, making this the most common form of gardening. Smaller groups cultivate fruit-bearing plants (7 households) and herbs (5 households), while a few maintain house plants or household gardens (2), community gardens (1), or unspecified plants (1). However, a significant portion—33 households—reported no gardening activity at all. This suggests that while gardening is present and diverse, nearly half of the households do not engage in it, possibly due to space limitations, lifestyle preferences, or other constraints. Collectively, the findings highlight both the role of gardening in supplementing food sources and household greenery, and the notable absence of such practices among many families, which may reflect differences in resources, priorities, or access to land.

C. Sanitation and Waste Disposal

Sanitation and waste disposal practices reveal how households handle the by-products of daily living and maintain their immediate environment. The reported methods—ranging from municipal collection services to burning, open

dumping, composting, or other alternatives—illustrate both the presence of formal systems and the reliance on household-level solutions.

WASTE DISPOSAL

Households adopt different methods to handle their daily waste, ranging from organized municipal collection to more informal practices like burning, open dumping, or composting. These responses highlight the mix of formal services and household-level strategies present in the community, offering a clear picture of how sanitation is managed at the local level.

Waste Disposal	Frequency	Percentage
Municipal Service	56	94.92%
Burned	3	5.08%
Open Dumping	0	0.00%
Compost Pit	0	0.00%
Other	0	0.00%
Total	59	100%

The Waste Disposal data shows that nearly all households rely on formal municipal services to manage their daily waste. Out of 59 households surveyed, 56 reported using municipal collection, while only 3 indicated that they burn their waste. No households reported open dumping, composting, or other disposal methods. This distribution highlights a strong dependence on organized waste management systems, which suggests that the community is well-integrated into local service provision. At the same time, the small number of households resorting to burning indicates that while formal systems are dominant, there are still minor gaps where families rely on informal practices. Taken together, the findings emphasize both the effectiveness of municipal services and the need to address the few cases where households manage waste outside of formal collection.

SOURCE OF WATER

Households rely on different sources to meet their water needs, ranging from piped connections and delivered supply to wells and other alternatives. These categories highlight the mix of formal and informal systems present in the community. By noting the variety of sources, the data provides a clearer picture of how families secure water for daily use and the extent of diversity in access across households.

Source of Water	Frequency	Percentage
NAWASA	22	37.29%
Piped	27	45.76%
Delivered	5	8.47%

Well	4	6.78%
Other	1	1.69%
Total	59	100%

The Source of Water data reveals a diverse mix of household access points, reflecting both formal and informal systems. Out of 59 households, the largest group (27) reported using piped connections, while 22 rely on NAWASA, the national water supply system. Smaller segments depend on delivered water (5 households), wells (4 households), or other sources (1 household). This distribution shows that while most families are connected to structured supply systems, a notable portion still relies on alternative arrangements. In totality, the findings highlight both the strength of formal infrastructure and the persistence of supplementary sources, which may be shaped by location, reliability of service, or household preference. This mix underscores the importance of ensuring consistent and equitable access to safe water across the community.

TOILET FACILITIES

Households make use of different types of toilet facilities, ranging from flush systems and manual flush units to pit latrines, shared arrangements, or the absence of any facility. These categories reflect the variety of sanitation options available within the community. Presenting this information provides a clearer view of household-level hygiene infrastructure and highlights the differences in access to basic sanitary provisions.

Toilet Facilities	Frequency	Percentage
Flush Toilet	48	81.36%
Manual Flush	6	10.17%
Shared Toilet	4	6.78%
No Facility	1	1.69%
Other	0	0.00%
Total	59	100%

D. Environmental Risks

Environmental risks capture household exposure to natural hazards and the strategies communities adopt to reduce vulnerability. Flooding, in particular, is a recurring concern that affects safety, property, and livelihood. By documenting which households are prone to floods and how families monitor updates, the profile highlights both the scale of risk and the resilience measures in place.

FLOOD-PRONE HOUSEHOLDS

Flood-prone households represent the segment of the community most directly exposed to environmental hazards. Identifying them provides insight into the distribution of vulnerability and the need for targeted interventions in disaster preparedness and infrastructure planning.

Flood-Prone Households	Frequency	Percentage
Yes	45	76.27%
No	14	23.73%
Total	59	100%

Out of 59 households, 45 reported being located in flood-prone areas, while 14 indicated they are not. This means that more than three-quarters of families face direct exposure to flooding during heavy rains. Such a high proportion underscores the community’s susceptibility to environmental risks and highlights the importance of mitigation strategies, such as drainage improvements, relocation planning, or early warning systems.

FLOOD-MONITORING PRACTICES

Flood-monitoring practices reflect how households stay informed about potential hazards. These mechanisms—whether digital or traditional—are crucial for timely response and community safety.

Flood-Monitoring Practices	Frequency	Percentage
Yes, via SMS/Social Media	28	47.46%
Yes, via Public Address System	30	50.85%
No	1	1.69%
Total	59	100%

Among the surveyed households, 28 reported monitoring flood updates via SMS or social media, while 30 relied on public address systems. The near-equal distribution shows that both digital platforms and community-based announcements play significant roles in risk communication. This dual reliance suggests adaptability: households use modern technology where available, but traditional systems remain vital, especially in areas with limited connectivity. Together, these practices demonstrate a layered approach to preparedness, combining immediacy with inclusivity.

E. Infrastructure Access

Infrastructure access reflects the systems, resources, and household conditions that shape daily living. It includes transportation, pets, devices, and security measures—each of which provides insight into how families connect to mobility, technology, and safety within their environment.

PRIMARY MODE OF TRANSPORTATION

Transportation patterns reveal how households move within and beyond their communities. They highlight reliance on public systems, private vehicles, or non-motorized options, and provide a window into accessibility and mobility.

Mode of Transportation	Frequency	Percentage
Motorcycle	27	45.76%
Public Transit	15	25.42%
Walking	6	10.17%
Car	1	1.69%
Bicycle	2	3.39%
Tricycle	8	13.56%
Total	59	100%

Out of 59 households, the most common mode of transportation is the motorcycle (27 households), followed by public transit (15) and tricycles (8). Smaller groups rely on walking (6), bicycles (2), or cars (1). This distribution shows that motorcycles dominate household mobility, reflecting affordability and flexibility, while public transit remains a significant option. The presence of walking and bicycles indicates that some households rely on basic, low-cost means of travel, underscoring varied accessibility levels across the community.

HOUSEHOLD PETS

Pets and domestic animals illustrate household lifestyle, companionship, and in some cases, livelihood practices. Documenting them provides a glimpse into both cultural preferences and environmental conditions.

Household Pets	Frequency	Percentage
Dog	32	43.84%
Cat	12	16.44%
Chicken	6	8.22%
Duck	3	4.11%
Bird	2	2.74%
Fish	1	1.37%
None	17	23.29%
Total	73	100%

Note: Multiple responses were gathered during the profiling.

Across 73 responses, dogs (32 households) are the most common pets, followed by cats (12). Other households reported raising chickens (6), ducks (3), birds (2), or fish (1). Notably, 17 households reported none. This mix suggests

that pets are widespread, with dogs and cats dominating, while chickens and ducks reflect backyard or livelihood practices. The presence of households without pets highlights diversity in lifestyle choices and resource allocation.

DEVICES AND DIGITAL CONNECTIVITY

Household devices reflect access to technology and digital platforms, shaping communication, learning, and participation in broader social and economic activities.

Devices	Frequency	Percentage
Smartphones	55	63.22%
Television	6	6.90%
Desktop Computer	6	6.90%
Tablet/iPad	9	10.34%
Smart Speaker	6	6.90%
Laptop	1	1.15%
None	3	3.45%
Total	86	100%

Note: Multiple responses were gathered during the profiling.

Out of 87 recorded responses, smartphones (55 households) are by far the most common device, underscoring their role as the primary tool for connectivity. Other devices include tablets/iPads (9), televisions (6), desktop computers (6), and smart speakers (6), with laptops (1) and electric fan (1) appearing occasionally. Three households reported none. This distribution highlights the centrality of smartphones in digital inclusion, while the presence of multiple devices in some households suggests varied levels of technological access and diversification.

SECURITY MEASURES

Security measures, such as CCTV installation, reflect household efforts to ensure safety and monitor risks. They provide insight into how families invest in protective infrastructure.

CCTV Installation	Frequency	Percentage
Yes	12	20.34%
No	47	79.66%
Total	59	100%

Out of 59 households, 12 reported having CCTV installed, while 47 did not. This indicates that most families rely on broader community or informal safety measures rather than household-level surveillance. The minority with

CCTV suggests heightened concern for security or greater resources to invest in protective technology. Taken together, the data shows that while digital connectivity is widespread, household security infrastructure remains limited.

IV. HEALTH AND NUTRITION

Health and nutrition indicators provide a window into the everyday well-being of households. They capture how families manage rest, food consumption, and medical needs, while also reflecting the presence of illnesses, maternal health, and child care practices. Examining these aspects reveals both the adequacy of nutrition and the accessibility of healthcare services, highlighting patterns that shape physical resilience and quality of life within the community. By documenting sleep routines, dietary habits, healthcare utilization, and household health conditions, this section situates well-being not only in terms of individual practices but also in relation to broader systems of support and access.

SLEEP AND REST PATTERNS

Sleep duration reflects household rest and recovery, which are essential for maintaining health, productivity, and overall well-being. Documenting sleep patterns helps identify whether families achieve adequate rest or experience constraints that may affect daily functioning.

Sleep and Rest Patterns	Frequency	Percentage
2 hours	1	1.7%
4 hours	13	22.0%
5 hours	1	1.7%
6 hours	10	16.9%
7 hours	5	8.5%
8 hours	27	45.8%
10 hours	1	1.7%
Other	1	1.7%
Total	59	100%

Nearly half of households (27 out of 59) report sleeping 8 hours, aligning with recommended rest. However, a significant portion (13 households) sleep only 4 hours, and 10 households sleep 6 hours, suggesting sleep deprivation in many families. Very few report extended rest (10 hours or “other”). In general, while many achieve adequate sleep, a notable minority experience insufficient rest, which may affect health and productivity.

FACTORS AFFECTING SLEEP QUALITY

Beyond duration, sleep quality is shaped by psychological, environmental, occupational, and biological factors. Identifying these disruptions highlights stressors that influence household well-being.

Factors Affecting Sleep Quality	Frequency	Percentage
Psychological and Mental Factors	20	33.9%
Environmental Disruptions	9	15.3%
Occupational and Lifestyle Demands	14	23.7%
Biological and Health Factors	4	6.8%
No Disruption	12	20.3%
Total	59	100%

The most common disruptions are psychological/mental factors (20 households) and occupational/lifestyle demands (14 households), pointing to stress and work pressures as key influences. Environmental disruptions (9) and biological/health factors (4) are less frequent. Encouragingly, 12 households report no disruption. In totality, stress and work demands dominate sleep quality concerns.

MEAL FREQUENCY AND DIETARY HABITS

Meal frequency reflects household nutrition and food security. It indicates whether families meet basic dietary needs or face constraints that may affect health.

Meal Frequency and Dietary Habits	Frequency	Percentage
1	0	0%
2	10	16.9%
3	44	74.6%
4	4	6.8%
5	1	1.7%
Total	59	100%

Most households (44 out of 59) eat 3 meals daily, consistent with standard dietary expectations. However, 10 households report only 2 meals, suggesting possible food insecurity. A small number eat 4–5 meals, reflecting greater food availability. With these, the majority maintain typical routines, but a notable minority face nutritional constraints.

NUTRITIONAL CONCERNS AND HEALTH RISKS

Nutritional concerns highlight whether households experience undernutrition, poor diet quality, or related health risks. This indicator connects food access with health outcomes.

Nutritional Concerns and Health Risks	Frequency	Percentage
Yes	15	25.4%
No	44	74.6%
Total	59	100%

A quarter of households (15) report nutritional concerns, while the majority (44) do not. This suggests that while most families feel nutritionally secure, a significant minority face risks such as undernutrition or poor diet quality, warranting attention in community health planning.

HOUSEHOLD FOOD BUDGETING

Food budgeting reflects household economic capacity to secure nutrition. It highlights disparities in purchasing power and the affordability of dietary needs.

Household Food Budgeting	Frequency	Percentage
Free	1	1.7%
500-999	6	10.2%
1000-1499	6	10.2%
1500-1999	5	8.5%
2000-2499	8	13.6%
2500-2999	4	6.8%
3000-3499	12	20.3%
3500-3999	6	10.2%
4000-4999	4	6.8%
5000-9999	4	6.8%
10000-24999	2	3.4%
25000 and above	1	1.7%
Total	59	100%

The largest group (12 households) spend ₱3000–₱3499 monthly on food, marking this as the most common budget range. Smaller groups spend less than ₱1000 (6 households) or more than ₱10,000 (3 households), showing wide disparities. One household reported no food budget (free), indicating extreme

vulnerability. Taken together, most households cluster around ₱2000–₱4000, reflecting modest but varied purchasing power.

FOOD CONSUMPTION AND PREPARATION PRACTICES

Food consumption and preparation practices provide insight into household dietary patterns, preferences, and resource availability. The data reflects the balance between reliance on fresh produce and protein sources, alongside processed and convenience foods. These practices highlight both cultural eating habits and the economic realities that shape household nutrition.

Food Consumption and Preparation Practices	Frequency	Percentage
Vegetables	35	25.93%
Poultry	12	8.89%
Meat	25	18.52%
Canned Goods	7	5.19%
Fruits	5	3.70%
Frozen Goods	2	1.48%
Fish	28	20.74%
Noodles	3	2.22%
Others	16	11.85%
Unspecified	2	1.48%
Total	135	100%

Note: Multiple responses were gathered during the profiling.

The data shows that vegetables (25.93%) and fish (20.74%) dominate household food consumption, underscoring the community’s reliance on fresh produce and seafood as staple items. Meat (18.52%) also plays a significant role, while poultry (8.89%) provides a smaller but notable protein source.

Processed and convenience foods such as canned goods (5.19%), noodles (2.22%), and frozen goods (1.48%) appear less frequently, but their presence indicates reliance on affordable and storable options, especially for households with limited resources. Fruits (3.70%) are consumed less often compared to vegetables, suggesting possible affordability or accessibility constraints.

The “Others” category (11.85%) reflects diverse or mixed household staples not captured in standard classifications, while unspecified responses (1.48%) point to gaps in reporting.

In essence, household diets are anchored in fresh produce and protein sources, supplemented by processed items. This balance reflects both cultural

food preferences and economic realities, with households adapting their consumption based on availability, affordability, and storage capacity.

CHILD NUTRITION AND SNACK PROVISION

Child nutrition and snack provision reflect household practices in supporting children’s dietary needs beyond main meals. The data highlights the balance between nutritious options such as milk, vegetables, and fruits, and less healthy but more accessible items like biscuits, junk food, and softdrinks. These patterns reveal both cultural preferences and economic realities that shape how families provide for children’s daily sustenance.

Child Nutrition and Snack Provision	Frequency	Percentage
Biscuits	31	38.75%
Frozen Food	1	1.25%
Poultry	3	3.75%
Milk	5	6.25%
Juice	2	2.50%
Coffee	2	2.50%
Softdrinks	4	5.00%
Noodles	1	1.25%
Canned Goods	1	1.25%
Vegetables	3	3.75%
Fruits	1	1.25 %
Fish	2	2.50%
Junkfood	8	10.00%
Unspecified	9	11.25%
Other	7	8.75%
Total	80	100%

Note: Multiple responses were gathered during the profiling.

The data shows that biscuits (38.75%) dominate snack provision, reflecting affordability, convenience, and accessibility as primary drivers of household choices. Junk food (10%) and softdrinks (5%) also appear prominently, suggesting that many children’s snacks lean toward processed and less nutritious options.

Nutritious items such as milk (6.25%), vegetables (3.75%), and fruits (1.25%) are present but less frequent, indicating limited emphasis on healthier

snacks. Protein sources like poultry (3.75%) and fish (2.5%) are rarely provided as snacks, showing that these foods are likely reserved for main meals.

The unspecified (11.25%) and other (8.75%) categories highlight diverse or unclear practices, possibly including mixed household staples or improvised snacks.

Altogether, child snack provision is heavily skewed toward processed foods, with limited inclusion of fresh and nutrient-rich items. This pattern underscores the need for nutrition education, affordable healthy alternatives, and community support programs to encourage households to prioritize balanced snacks for children’s growth and well-being.

FOOD STORAGE AND SAFETY

Food storage practices reveal how households preserve and protect their supplies. They reflect both access to modern appliances and reliance on traditional methods, which in turn influence food safety, longevity, and household health.

Food Storage and Safety	Frequency	Percentage
Refrigerator	28	47.5%
Table with cover	18	30.5%
Basket	9	15.3%
Plastic	1	1.7%
Others	2	3.4%
None	1	1.7%
Total	59	100%

Nearly half of households (28) rely on refrigerators, showing access to modern preservation methods. However, a substantial portion (18 households) still use tables with covers, and 9 households use baskets, reflecting traditional storage practices that may expose food to contamination or spoilage. The presence of plastic containers (1) and others (2) indicates adaptive but less standardized methods. One household reported no storage, highlighting vulnerability. By and large, while refrigeration is common, traditional practices remain significant, pointing to economic disparities and potential food safety risks.

HEALTHCARE UTILIZATION

Healthcare utilization patterns show whether households seek medical services proactively or only in response to illness. They highlight attitudes toward preventive care and accessibility of health facilities.

Healthcare Utilization	Frequency	Percentage
Only if there is a sick member of the family	47	79.7%

When a child needs to be immunized	8	13.6%
Monthly Check-up	3	5.1%
Other	1	1.7%
Total	59	100%

The majority (47 households) visit health centers only when someone is sick, showing a reactive approach to healthcare. Preventive care is rare, with only 3 households reporting monthly check-ups. Child immunization (8 households) is the second most common reason, underscoring the importance of maternal and child health programs. The data suggests that preventive health practices are limited, and healthcare access is primarily illness-driven, which may contribute to unmanaged chronic conditions.

PRIMARY CONSULTATION IN ILLNESS

The first person consulted during illness reflects trust, accessibility, and reliance on formal versus informal healthcare providers.

Primary Consultation in Illness	Frequency	Percentage
Rural Health Doctor	38	62.3%
Private Doctor	7	11.5%
Relative	8	13.1%
Midwife	3	4.9%
Faith Healer	2	3.3%
Nurse	1	1.6%
Company Clinic	1	1.6%
None	1	1.6%
Total	61	100%

Note: Multiple responses were gathered during the profiling.

Most households (38) consult rural health doctors, showing reliance on government health services. Private doctors (7) and relatives (8) are secondary sources, reflecting both formal and informal care pathways. Midwives (3) and faith healers (2) highlight community-based and traditional practices that persist alongside modern medicine. Rare mentions of nurses, company clinics, and none suggest limited alternative access. All things considered, the data shows strong dependence on rural health units, but traditional and informal care remain part of the healthcare landscape.

UNMET MEDICAL NEEDS

Unmet medical needs highlight barriers that prevent households from accessing healthcare, ranging from financial constraints to logistical challenges.

Factors Linked with Unmet Medical Needs	Frequency	Percentage
Financial matters	14	21.2%
Health matters	5	7.6%
Distance	2	3.0%
Working schedule	2	3.0%
None	43	65.2%
Total	66	100%

Financial constraints are the most common barrier (14 households), underscoring the role of poverty in limiting healthcare access. Health matters (5), distance (2), and work schedules (2) also contribute, though less frequently. Encouragingly, 43 households reported no unmet needs, suggesting adequate access for the majority. Still, the presence of financial barriers highlights inequities that may leave vulnerable households untreated.

ACCESS TO HEALTHCARE SERVICES

Access to healthcare services reflects whether households can reach and utilize medical facilities when needed.

Access to Healthcare Services	Frequency	Percentage
Yes	47	79.7%
No	12	20.3%
Total	59	100%

Most households (47) report having access to healthcare services, but 12 households do not. This minority represents significant gaps in coverage, likely linked to distance, financial constraints, or facility limitations. While access is generally strong, the presence of households without healthcare access highlights areas for improvement in service delivery.

HEALTH INSURANCE COVERAGE

Health insurance coverage indicates financial protection against medical costs, reducing vulnerability to health-related expenses.

Health Insurance Coverage	Frequency	Percentage
SSS	3	4.8%

PhilHealth	20	32.3%
BDO Life	1	1.6%
Health Card	1	1.6%
None	37	59.7%
Total	62	100%

Note: Multiple responses were gathered during the profiling.

The majority (37 households) lack health insurance, leaving them financially vulnerable. PhilHealth (20 households) is the most common coverage, reflecting government support. Very few households have private insurance (SSS, BDO Life, Health Card). In essence, insurance coverage is limited, with most families exposed to out-of-pocket costs.

HOUSEHOLD ILLNESSES

Household illnesses reveal the prevalence of chronic and acute conditions, shaping community health needs.

Household Illnesses	Frequency	Percentage
Hypertension	28	28.3%
Diabetes	9	9.1%
Heart Illness	3	3.0%
Stroke	4	4.0%
Seizures	2	2.0%
Asthma	1	1.0%
Cerebral Palsy	1	1.0%
Orthopedic Complications	1	1.0%
Eczema	1	1.0%
Vertigo	1	1.0%
Lung Problems	1	1.0%
Cough	1	1.0%
Undiagnosed	1	1.0%
None	44	44.4%
Total	99	100%

Note: Multiple responses were gathered during the profiling.

Chronic conditions dominate: hypertension (28 households) is most prevalent, followed by diabetes (9) and stroke (4). These non-communicable

diseases highlight long-term health risks. A large portion (44 households) reported no illness, showing resilience. Rare conditions (seizures, asthma, cerebral palsy, eczema, vertigo, lung problems) reflect diverse but isolated health challenges. Broadly speaking, chronic disease management emerges as a key priority.

MATERNAL HEALTH AND PREGNANCY

Maternal health indicators show the presence of pregnancies and the level of prenatal care within households.

Maternal Health and Pregnancy	Frequency	Percentage
0-3 months	1	1.7%
4-6 months	0	0%
7-9 months	1	1.7%
None	57	96.6%
Total	59	100%

The data shows that pregnancies are rare within the community, with only two households reporting ongoing pregnancies—one in the early stage (0–3 months) and another in the late stage (7–9 months). No households reported pregnancies in the mid-term stage (4–6 months).

The overwhelming majority of households (96.6%) reported no current pregnancies, underscoring limited maternal health activity at the time of profiling. This distribution suggests that while maternal health needs exist, they are concentrated in very few households. The findings highlight the importance of ensuring targeted prenatal care and maternal support programs for those currently pregnant, while also maintaining readiness for future maternal health needs across the community.

PRENATAL SUPERVISION

Prenatal supervision reflects where pregnant women seek care, showing the role of local health facilities and the extent of institutional support.

Prenatal Supervision	Frequency	Percentage
Barangay Health Center	1	1.7%
Rural Health Unit	1	1.7%
Lying-in	1	1.7%
Municipal Hospital	2	3.4%
None	54	91.5%
Total	59	100%

Only 5 households reported prenatal supervision, spread across barangay health centers, rural health units, lying-in clinics, and municipal hospitals. The overwhelming majority (54 households) reported none, which may reflect either the absence of pregnancies or gaps in prenatal monitoring. This underscores the need to strengthen maternal health programs and ensure that pregnant women consistently access professional care.

RECENT BIRTHS AND DELIVERY PRACTICES

Delivery practices highlight where and how births occur, reflecting both access to medical facilities and reliance on traditional or home-based practices.

Recent Births and Delivery Practices	Frequency	Percentage
Hospital	4	6.8%
Lying-in	2	3.4%
Home	2	3.4%
None	51	86.4%
Total	59	100%

Most households (51) reported no recent births, but among those that did, hospital deliveries (4) were most common, followed by lying-in clinics (2) and home births (2). The presence of home deliveries suggests that some families may face barriers to institutional care, whether financial, cultural, or logistical. Hospital deliveries dominate, reflecting trust in formal healthcare, but lying-in clinics remain relevant as accessible alternatives.

CHILD VACCINATION STATUS

Child vaccination status indicates the extent of immunization coverage, which is vital for preventing communicable diseases and safeguarding child health.

Child Vaccination Status	Frequency	Percentage
Hepatitis B	3	4.1%
Oral Polio Vaccine (OPV)	3	4.1%
Influenza Vaccine	1	1.4%
Inactivated Polio Vaccine (IPV)	2	2.7%
Measles Vaccine	1	1.4%
Pneumonia	2	2.7%
Bacille Calmette-Guérin (BCG) vaccine	2	2.7%

Pentavalent Vaccine	1	1.4%
Pneumococcal Conjugate Vaccine	1	1.4%
Mums	1	1.4%
Rubella	1	1.4%
Tuberculosis	1	1.4%
Vitamin K	1	1.4%
Not Specified	1	1.4%
None	52	71.2%
Total	73	100%

Note: Multiple responses were gathered during the profiling.

The majority (52 households) reported no vaccination, revealing significant gaps in child immunization coverage. Among those vaccinated, the most common are Hepatitis B and OPV (3 households each), followed by smaller numbers for measles, pneumonia, BCG, and other vaccines. The diversity of vaccines reported shows awareness of immunization programs, but the low overall coverage suggests barriers such as limited access, financial constraints, or lack of awareness. This highlights a critical area for public health intervention, as low vaccination rates increase vulnerability to preventable diseases.

V. EDUCATION, SOCIAL SUPPORT, AND PARTICIPATION

Education, social support, and participation indicators highlight how households build human capital, connect with community networks, and engage in collective life. These dimensions go beyond individual well-being, showing how families access learning opportunities, receive assistance, and contribute to social organizations. Educational attainment reflects the community’s capacity for skilled labor and upward mobility, while social support reveals the strength of institutional and informal safety nets. Participation in local groups and caregiving roles illustrates inclusiveness and the resilience of social ties. Taken together, these indicators provide a holistic view of how households balance personal development with collective responsibility, shaping both immediate living conditions and long-term prospects for community growth.

NUMBER OF SCHOOL-AGED CHILDREN

The number of school-aged children per household provides a clear picture of educational demand and caregiving responsibilities within the community. This indicator highlights both the presence of families with multiple children requiring schooling and those without school-aged dependents, shaping household priorities and resource allocation.

Number of School-Aged Children	Frequency	Percentage
0	18	32.14%

1	9	16.07%
2	17	30.36%
3	9	16.07%
4	2	3.57%
5	0	0.00%
6	1	1.79%
Total	56	100%

The data shows that nearly one-third of households (32.14%) have no school-aged children, reflecting either older family structures or households without dependents. The largest group is households with two school-aged children (30.36%), followed closely by those with one (16.07%) or three (16.07%). Very few households report four (3.57%) or six (1.79%) children, and none reported five.

This distribution suggests that while many households sustain small to medium-sized school-aged populations, larger families with multiple dependents are rare. The findings highlight both the strong presence of households actively engaged in education and the significant proportion without school-aged children, which may influence community priorities in terms of schooling resources, childcare, and educational support programs.

CURRENT ENROLLMENT FIGURES

Enrollment figures provide a snapshot of how many school-aged children are currently participating in formal education. This indicator reflects both household commitment to schooling and the accessibility of educational opportunities. Presenting the data in a frequency distribution highlights patterns of full, partial, or non-enrollment across households.

Current Enrollment Figures	Frequency	Percentage
0	21	35.59%
1	9	15.25%
2	18	30.51%
3	10	16.95%
4	1	1.69%
Total	59	100%

HOUSEHOLD INCOME SOURCES

Household income sources reflect the economic foundations of families and their capacity to sustain monthly needs. They highlight whether households

rely on stable salaried employment, informal labor, entrepreneurial activity, or external support such as pensions, remittances, and government assistance.

Household Income Sources	Frequency	Percentage
Salaried Employment / Wage Earner	29	47.5%
Daily Labor / Casual Work	10	16.4%
Self-employment / Business (incl. Sari-sari store, cook, tricycle/jeepney driver, parts modeller, finance, etc.)	9	14.8%
Pension / Retirement Benefits	3	4.9%
Remittances / Overseas Family Support	2	3.3%
Social Welfare / Government Assistance	3	4.9%
Company Driver / Extra (On-call) / Allowance	3	4.9%
Other (unspecified / mixed entries)	2	3.3%
Total	61	100%

Note: Multiple responses were gathered during the profiling.

The majority of households depend on salaried employment or wage earning, underscoring the importance of formal labor markets in sustaining livelihoods. A significant portion, however, rely on daily labor or casual work, which is often unstable and exposes families to economic insecurity. Self-employment and small businesses provide alternative income streams, reflecting entrepreneurial adaptability. Smaller groups benefit from pensions, remittances, or government assistance, which serve as supplementary support but are not widespread. The presence of diverse sources such as drivers, cooks, allowances, and mixed combinations shows that households often piece together multiple streams to meet needs. In general, while formal employment dominates, the reliance on informal and varied sources highlights both the creativity and precarity of household economies.

INCOME SUFFICIENCY

Income sufficiency measures whether households feel their earnings are enough to cover monthly needs, reflecting economic stability and vulnerability.

Income Sufficiency	Frequency	Percentage
Yes	35	59.3%
No	24	40.7%
Total	59	100%

A majority of households (35) report that their income is sufficient, suggesting relative stability. However, a substantial minority (24 households) struggle to meet monthly needs, highlighting economic stress. This divide shows that while many families manage, a significant portion remain vulnerable to financial shocks, with insufficiency often linked to reliance on casual labor or limited income sources.

GOVERNMENT ASSISTANCE

Government assistance reflects the reach of social protection programs and their role in supporting household needs.

Government Assistance	Frequency	Percentage
4Ps	11	18.6%
SAP	1	1.7%
Local Relief Aid	2	3.4%
None	45	76.3%
Total	59	100%

Most households (45) reported no government assistance, showing limited reach of social protection programs. The 4Ps program (11 households) is the most common form of support, reflecting its role as a targeted poverty-alleviation initiative. Smaller groups benefit from SAP (1) and local relief aid (2), which are typically short-term measures. On the whole, while some families benefit from structured programs, most remain outside government support systems, highlighting gaps in coverage and the need for broader inclusion.

COMMUNITY ORGANIZATION INVOLVEMENT

Community organization involvement shows household participation in collective activities, strengthening social capital and local governance.

Community Organization Involvement	Frequency	Percentage
Barangay Officers/Workers	2	3.4%
Barangay Health Worker	1	1.7%
Solo Parent	1	1.7%

Senior Citizen	1	1.7%
PWD Organization	1	1.7%
TUPAD	1	1.7%
Volunteer	1	1.7%
None	51	86.4%
Total	59	100%

Community participation is limited, with 51 households reporting no involvement. A small number engage through roles such as barangay officers, health workers, solo parent groups, senior citizen associations, PWD organizations, TUPAD, or volunteer work. This suggests that while formal participation is rare, those involved contribute to local initiatives. Strengthening awareness and opportunities for engagement could enhance social cohesion and collective resilience.

PRESENCE OF ELDERLY MEMBERS

The presence of elderly members highlights caregiving responsibilities and the need for age-sensitive support.

Presence of Elderly Members	Frequency	Percentage
Yes	21	35.6%
No	38	64.4%
Total		100%

About one-third of households (21) have elderly members, indicating caregiving responsibilities and potential health needs. The majority (38 households) do not, suggesting fewer dependency concerns. This highlights the importance of age-sensitive programs and healthcare services for households with seniors.

PRESENCE OF PERSONS WITH DISABILITIES

The presence of persons with disabilities reflects inclusiveness and the need for specialized support within households.

Presence of Persons with Disabilities	Frequency	Percentage
Cerebral Palsy	1	1.7%
Hearing Impairment	1	1.7%
Paralyzed	1	1.7%
Unspecified	4	6.8%

No	52	88.1%
Total	59	100%

Most households (52) reported no PWDs, but 7 households identified members with disabilities, including cerebral palsy, hearing impairment, paralysis, and unspecified conditions. While PWDs are a minority, their presence underscores the importance of inclusive programs, accessible infrastructure, and targeted health and social support to ensure equity in community participation.

OBSERVATION AROUND THE SITIO

The observations around the sitio reveal a community that is resilient yet facing persistent challenges. Infrastructure concerns are common, with households noting broken streetlights, poor drainage, flood-prone areas, and difficulties in electricity connections. Basic needs shortages are also evident, as families request food, medicine, vitamins for children, and financial assistance for daily living. Economically, many households struggle with insufficient income, unstable work, or reliance on remittances, while others highlight the need for more job opportunities and fairer government aid distribution.

Health vulnerabilities are visible, with families reporting chronic illnesses such as hypertension, diabetes, and paralysis, alongside requests for proper nutrition, safe bedding, and medical supplements. Socially, residents express concerns about safety, particularly avoiding drinking sessions and fights, and emphasize the importance of waste management and community cleanliness. Yet, amidst these challenges, households also highlight positive aspects: welcoming family members, fresh air, fruit-bearing trees, and cooperative attitudes. Collectively, the sitio reflects both strengths in solidarity and adaptability and weaknesses in infrastructure, health access, and economic security, pointing to areas where targeted interventions could significantly improve quality of life.

Categorical Observation	Common Issues/Needs	Representative Notes
Infrastructure	Streetlights, drainage, flood control, electricity	“Madilim ang daan, walang ilaw”; “Prone to flood”
Basic Needs & Health	Food, medicine, vitamins, healthcare support	“Need grocery and gamot for baby”; “Additional medical supplements”
Economic Conditions	Insufficient income, need for work opportunities, reliance on remittances	“MS. Ellen’s income is not enough”; “They need more work opportunities”
Social Environment	Safety concerns, waste management, community engagement	“Maiwasan ang nag-iinuman at nag-aaway”; “Proper waste segregation”

Positive Observations	Stable households, fresh air, fruit-bearing trees, welcoming families	“The family is living healthy, welcoming and nice”
-----------------------	---	--

SUMMARY OF FINDINGS

The summary of findings presents a consolidated view of the household profiling conducted within the community. It brings together quantitative data and qualitative observations to highlight the living conditions, resources, and challenges faced by families. The results are organized thematically—covering health and nutrition, education, economic conditions, social support and participation, and environmental observations around the sitio.

This section underscores both the resilience and adaptability of households and the persistent vulnerabilities that shape daily life. While many families demonstrate stability through formal employment, school enrollment, and cooperative social ties, others struggle with insufficient income, limited access to healthcare, and infrastructural gaps such as poor drainage, unreliable electricity, and inadequate waste management. The findings also reveal the presence of elderly members and persons with disabilities, pointing to the need for inclusive programs and age-sensitive support.

By weaving together statistical distributions and lived experiences, the summary provides a holistic picture of the community—one that balances strengths with areas requiring targeted intervention. It serves as the foundation for reflection, planning, and action toward improving quality of life and fostering sustainable development in the sitio.

Health and Nutrition. Most households reported no current pregnancies, with only two expectant mothers identified, underscoring limited maternal health activity but pointing to the need for targeted prenatal care. Chronic illnesses such as hypertension and diabetes were noted, while food consumption patterns showed reliance on vegetables, fish, and meat, with processed foods and limited fruit intake suggesting nutritional gaps.

Education. The data revealed strong attainment at the elementary and high school levels, with 19.63% of respondents being high school graduates, yet progression to higher education remained limited, with only 8.22% completing college and 0.46% attaining postgraduate studies. Enrollment figures showed that while many households sustain schooling for one to three children, a significant portion reported none, reflecting both demographic variation and possible financial constraints.

Economic Conditions. Economic conditions, nearly half of households earned below ₱10,000 monthly, pointing to widespread poverty and financial vulnerability. A modest cluster earned between ₱10,000–₱19,999, reflecting fragile stability, while only 3.39% reported incomes above ₱60,000, underscoring stark inequality and the absence of a middle-income bracket. Sector affiliation further revealed diversity, with 15.25% of households identifying as indigenous and 18.64% reporting overseas workers, reflecting both cultural richness and reliance on labor migration.

Government Assistance. This facet was limited, with many households reporting no access to programs such as 4Ps or relief aid, highlighting gaps in social protection coverage.

Community Organization Involvement. Participation in community organizations was minimal, suggesting weak civic engagement and limited collective action.

Presence of Elderly Members and Persons with Disabilities (PWDs). The profiling also noted the presence of elderly members and persons with disabilities (PWDs), pointing to the need for inclusive programs and age-sensitive support. Elderly members add caregiving responsibilities, while PWDs highlight the importance of accessible infrastructure and targeted services.

Observation Around the Sitio. Observations around the sitio revealed mixed living conditions and infrastructure: while 30.51% of households owned homes outright, 27.12% rented and 16.95% were informal settlers, exposing many to insecurity. Utilities showed near-universal electricity access (98.31%), but internet connectivity was uneven (61.02%), limiting digital inclusion. Water sources were diverse, with households relying on piped supply, NAWASA, delivered water, and wells, while sanitation was relatively strong, with 81.36% using flush toilets and 94.92% relying on municipal waste collection. Environmental risks were severe, with 76.27% of households located in flood-prone areas, underscoring urgent needs for drainage improvements and disaster preparedness. Transportation was dominated by motorcycles (45.76%), reflecting affordability and flexibility, while household gardening was limited, with nearly half reporting no cultivation. Security measures were minimal, with only 20.34% of households installing CCTV, indicating reliance on community-level safety rather than household surveillance.

Taken together, the findings portray Sitio Bihunan as a community that demonstrates resilience through strong basic education, widespread electricity access, and reliance on staple foods, yet continues to face vulnerabilities in income inequality, housing insecurity, flood exposure, and limited digital connectivity. Weak social support systems and minimal civic participation further constrain collective resilience. These realities highlight the need for inclusive, multi-sectoral interventions that strengthen education, healthcare, housing, and disaster preparedness while fostering civic engagement and cultural inclusivity to improve quality of life and promote sustainable development in the sitio.

CONCLUSION

The community profiling of Sitio Bihunan, Biñang 2nd, Bocaue, Bulacan reveals a locality marked by both resilience and vulnerability. Families demonstrate adaptability through widespread access to electricity, basic education attainment, and cooperative social ties, yet persistent challenges remain in the form of low household incomes, housing insecurity, uneven internet connectivity, and high exposure to flooding. The data underscores that while many households achieve stability through ownership of homes, consistent schooling, and overseas remittances, others struggle with poverty, limited access to healthcare, and reliance on informal arrangements.

The presence of elderly members, persons with disabilities, and indigenous households highlights the importance of inclusive and culturally sensitive interventions. At the same time, weak civic participation and limited government assistance point to gaps in social protection and collective action. Environmental risks, particularly flooding, further compound vulnerabilities, making disaster preparedness and infrastructure improvements urgent priorities.

Overall, the findings emphasize the need for multi-sectoral, inclusive, and sustainable development strategies. Strengthening education pathways, expanding healthcare access, improving housing and infrastructure, and fostering community organization will be critical in ensuring that no household is left behind. By situating these realities within broader development goals, the profiling serves not only as a descriptive account of current conditions but also as a foundation for responsive planning, policy-making, and community empowerment.

RECOMMENDATIONS

Building on the findings of the community profiling in Sitio Bihunan, Biñang 2nd, Bocaue, Bulacan, the following recommendations are proposed to address identified needs and strengthen household resilience. The data revealed both areas of stability—such as widespread electricity access and basic education attainment—and persistent vulnerabilities, including low household incomes, housing insecurity, limited digital connectivity, and high exposure to flooding. These realities call for targeted, practical, and inclusive interventions that can be feasibly implemented through academic institutions in partnership with local stakeholders.

The recommendations are designed to be community-based, sustainable, and responsive to the lived experiences of households. They emphasize health and nutrition, education, livelihood development, social support, and environmental preparedness, while also promoting inclusivity for elderly members, persons with disabilities, and indigenous households. By situating these initiatives within the strengths and challenges identified in the profiling, academic institutions can serve as catalysts for empowerment, capacity-building, and sustainable development.

Community Health Caravan. Academic institutions can organize quarterly medical missions with faculty and student volunteers, offering free check-ups, prenatal care, and monitoring for chronic illnesses like hypertension and diabetes.

Gardening Program. Partner with local institutions to establish vegetable gardens maintained by students, with harvests used to provide nutritious meals to children and reduce reliance on processed foods.

Nutrition Awareness Campaign. Conduct workshops and distribute educational materials on balanced diets, food budgeting, and affordable healthy cooking practices to improve household nutrition.

Digital Literacy Bootcamps. Offer training sessions for students and parents on basic computer skills, safe internet use, and online learning platforms to bridge digital gaps.

Community Learning Hub. Establish a small center with donated books, computers, and internet access to serve as a study space and resource hub for learners.

Scholarship Assistance Program. Facilitate scholarship applications and provide mentoring to help students transition from high school to college or vocational training.

Peer Tutoring Initiative. Mobilize college students to tutor elementary and high school learners in reading, math, and science, improving retention and performance.

Livelihood Training Workshops. Conduct hands-on workshops in baking, sewing, handicrafts, and urban gardening to equip households with income-generating skills.

Microenterprise Incubation Program. Support small business start-ups with seed funding, mentoring, and marketing assistance, guided by business students and faculty.

Community Cooperative Formation. Help households establish a cooperative for collective savings, lending, and product marketing, strengthening financial resilience.

Financial Literacy Campaign. Provide seminars on budgeting, savings, and debt management to empower families with practical financial skills.

Social Services Orientation Drive. Organize barangay-level seminars to inform households about government programs such as 4Ps, PhilHealth, and other assistance schemes.

Documentation Assistance Project. Assist families in securing IDs, birth certificates, and other requirements needed to access government aid.

Youth Volunteer Corps. Mobilize students to lead literacy drives, clean-up campaigns, and disaster preparedness activities, fostering civic participation.

Community Dialogue Forums. Facilitate regular forums where residents can voice concerns and co-create solutions with barangay leaders and academic partners.

Senior Wellness Club. Organize weekly activities for elderly members, including light exercise, storytelling, and health talks, to reduce isolation and promote well-being.

Intergenerational Mentorship Program. Pair students with elderly members for cultural exchange, oral history documentation, and mentorship.

Inclusive Skills Development for PWDs. Provide tailored livelihood training such as crafts or digital work for persons with disabilities to enhance economic participation.

Accessibility Audit Project. Engage engineering students to assess community infrastructure and recommend improvements for PWD accessibility.

Awareness Campaign on Disability Rights. Promote inclusivity and reduce stigma through seminars, posters, and community events led by students.

Flood Preparedness Initiative. Collaborate with engineering students to design low-cost drainage solutions and conduct flood drills to reduce disaster risks.

Community Gardening Expansion. Encourage households to grow vegetables and herbs, supported by agriculture students, to improve food security and sustainability.

Waste Management Education Campaign. Launch household-level training on segregation, recycling, and composting, with demonstrations by science students.

Digital Connectivity Enhancement. Provide shared Wi-Fi hubs or negotiate with providers for affordable community internet packages to improve digital inclusion.

Safe Mobility Program. Promote road safety awareness for motorcycle users and encourage bicycle use through student-led campaigns.

Community Safety Awareness Program. Train households in basic safety practices and explore low-cost surveillance initiatives to strengthen security.

Community E-Health Kiosk. Establish a small kiosk managed by students where residents can access basic health monitoring tools (blood pressure, glucose testing) and receive digital health education materials.

Mobile Learning Van. Deploy a van equipped with books, tablets, and Wi-Fi to rotate across sitios, providing access to learning resources for children and adults in areas with limited connectivity.

Skills-for-Service Exchange Program. Organize workshops where households learn practical skills (e.g., carpentry, sewing, cooking) and in return provide community service hours, fostering both livelihood and civic engagement.

Flood Resilience Innovation Lab. Partner with engineering and science students to co-design low-cost flood barriers, rainwater harvesting systems, and drainage prototypes that households can adopt.

Community Radio and Podcast Project. Launch a student-run local radio or podcast channel to disseminate information on health, education, disaster preparedness, and cultural storytelling.

Elderly Digital Companionship Program. Train students to teach elderly members how to use mobile phones and social media for communication, reducing isolation and strengthening family ties.

Inclusive Arts and Culture Festival. Organize an annual festival showcasing talents of youth, elderly, and PWDs, integrating cultural heritage with modern creative expression to build community pride.

Green Roof and Vertical Garden Initiative. Encourage households with limited land to adopt vertical gardening and rooftop planting, supported by agriculture students, to improve food security and reduce heat exposure.

Community Makerspace. Set up a small workshop with tools and materials where residents, guided by students, can learn DIY repairs, craft production, and innovation projects.

Digital Storytelling Archive. Collect oral histories, photos, and narratives from residents, curated by students, to preserve community identity and strengthen intergenerational learning.

Cooperative Internet Hub. Establish a shared Wi-Fi hub managed by a student-community cooperative, offering affordable digital access and training in online entrepreneurship.

Eco-Brick and Recycling Program. Train households to convert plastic waste into eco-bricks for use in small construction projects, reducing waste and promoting sustainability.

Community Theater for Awareness. Engage students and residents in producing plays or skits that dramatize issues like health, disaster preparedness, and social inclusion, making learning interactive.

PWD Tech Access Program. Provide assistive technologies such as screen readers, mobile apps, or adapted keyboards, with training sessions led by IT students to empower PWDs.

Inter-Barangay Youth Exchange. Facilitate exchange programs where youth from Sitio Bihunan collaborate with students from other barangays on shared projects, broadening perspectives and networks.

Solar-Powered Study Stations. Install solar-powered outdoor study stations with lights and charging ports, enabling students to study even during power interruptions or at night.

Community Disaster Simulation Games. Develop interactive workshops or gamified drills where households practice evacuation, resource management, and first aid in simulated disaster scenarios.

Elderly Wellness Home Visits. Organize student volunteers to conduct regular home visits for elderly members, offering companionship, light exercise routines, and monitoring of health conditions.

Women's Entrepreneurship Collective. Support women in forming small business groups focused on crafts, food products, or services, with training and marketing assistance from academic partners.

Sitio Bihunan Research Fellowship. Create a program where students conduct ongoing research projects in the sitio, generating data for continuous improvement and evidence-based interventions.

Ultimately, the proposed projects aim not only to address immediate needs but also to foster long-term resilience by equipping households with knowledge, skills, and resources. Through collaborative extension programs, student-led initiatives, and research-driven interventions, these recommendations seek to bridge gaps in education, health, and infrastructure while nurturing a culture of participation and inclusivity. In doing so, academic institutions can help transform Sitio Bihunan into a community that thrives despite its vulnerabilities, ensuring that development is both equitable and sustainable.
