

The Paraya Community Engagement Framework

To provide a more comprehensive overview of how our initiatives transition from conceptualization to community impact, the process follows a rigorous, data-driven Action Research Cycle. If you are developing an application to track or manage these initiatives, you can view these as the functional phases of the project's lifecycle.

Phase I: Diagnostic Observation & Environmental Scanning

Much like any formal experimentation or scientific study, the process begins fundamentally with Observation. We immerse ourselves in the community to identify existing gaps, social phenomena, or unmet needs. By utilizing an empirical lens at the start, we ensure that our engagement is grounded in reality rather than assumptions. This serves as the "Diagnostic Phase" where the initial spark for an intervention is identified.

Phase II: Problem Posing & Objective Formulation

Once the initial observation is established, we move toward formalizing our intent. In this phase, we ask: Why are we doing this? We begin to construct specific Objectives that define the purpose of the intervention for a particular community. These objectives serve as the North Star for the entire project, ensuring that every subsequent step—from data gathering to execution—is purposeful and aligned with the intended community impact.

Phase III: Research Design & Methodology

In this stage, we construct the blueprint for the initiative:

- Literature & Context: Researching existing methods or historical data that can inform our current approach.
- Instrumentation: Developing the tools for engagement, such as structured interview guides, survey questionnaires (Likert scales), or focus group discussion (FGD) protocols.

Phase IV: Data Collection & Data Cleaning

This is the "fieldwork" stage. However, raw data is often "noisy."

- Data Triangulation: We often gather both Quantitative (numerical) and Qualitative (narrative) data.
- Data Scrubbing/Filtering: This is a critical step where we "clean" the data. We filter out outliers or inconsistent responses to ensure that the analysis is based on high-quality, relevant inputs. This prevents "data pollution" and ensures a progressive, streamlined analysis.

Phase V: Systematic Analysis & Interpretation

We apply specific analytical lenses depending on the nature of the data gathered:

- Quantitative Analysis: Utilizing descriptive or inferential statistics to identify trends and frequencies.
- Qualitative Analysis: Utilizing Thematic Analysis to identify recurring patterns, sentiments, and narratives from interviews.
- Synthesis: Merging these findings to create a holistic interpretation of the community's status.

Phase VI: Conclusion, Recommendation, and Filing

Based on the evidence, we summarize our findings and draft Action Recommendations.

- Internal Filing: These results are first submitted to the Head of the Paraya Office for technical review.
- Administrative Endorsement: Once vetted, the proposal is endorsed to the Office of the President or the school administration for high-level approval and resource allocation.

Phase VII: Strategic Planning & Execution

With administrative backing, the initiative moves from paper to the pavement.

- Logistics & Implementation: Detailed scheduling, volunteer mobilization, and the actual execution of the community program.

Phase VIII: Post-Implementation Assessment

The cycle is never truly "finished" after execution. We conduct a final Impact Assessment to measure the effectiveness of the initiative. This data then feeds back into Phase I, creating a continuous loop of improvement for the community we serve.

A Note for the Capstone Researchers

For your application logic, these phases can be treated as a Sequential Workflow.
